Hi Martin! Hmm...okay, I've got NeoDesk/Geneva (too many incompatibilities
and its slow), I've got MultiTos (Freemint with AES 4.1) which I like but I
can't get STing to work with it (although it will work under this setup with
AES 4.0-go figure!), and I was looking for a solid multitasking environment
to run on my 16 meg Falcon with Nemesis and an 810 meg hard drive (something
that wouldn't slow it down to a crawl). Everyone says that Mint/MintNet is
solid and fast, and can run AES 4.1/N.AES/Thing so I'm at home with the desk
top. I can do this, right? ;-)

Thanks for your reply! ;-)

2. Falcon Upgrades+ MagiC support Page

Newsgroup: comp.sys.atari.st
Date: 1998-06-01 00:00:00 UTC
From: Bengy@my-dejanews.com
Message-ID: <6kue5u$r2o$1@nnrp2.dejanews.com>
Source record: 99793

Hello
I would like to add a second serial port to my falcon, aswell as put it in a PC case.. Are there any text files on how to do this in ENGLISH? I have DOITf030, but .. well, its german.
2)
As anyone who has visited the unofficial MagiC support Page knows, There wasnt very much up yet. Now later tonight I will upload the rest. In the Download bay there are over 30 magiC specific Apps ,as well as a modern-looking icon set you can download, In the ScreenShots there is snaps of:
ASH internet Package (FIFI, EMAILER, CAB,T2)
JINEE Desktop
Papyrus 5
Freedom 2.2
A large snap showing most (all) of the MagiC apps running.
(Note these snaps are all on a falcon030 running 880x660x16bit)
Then there is the tips and tricks section, but so far there are only 10 listed there.
There is a Section I would like to include, but need the help of the atari community. I would like to have a Giant MagiC compatability list, listing the programs that DO NOT work under MagiC, or if they require to be loaded in single tasking mode. The thing is though, I have not found any programs that I can not get to load under magiC (I guess because I use mostly modern apps). So If you would like to , Please send me an email or post which programs you have found do not load under MagiC.
Thankyou.
Please note this Major update of the site wont take place till later tonight.
The URL is:
http://bulli.com/basement/index.htm
This will not lead you directly to the MagiC page, But just follow the links. I cant link directly to the atri page YET because I havnt worked out a few things with the FRAMES. Also, ther is a counter on that page, which is not on the atari page yet :-)
--
Well as you can see there is still alot to do, but... well... it should be totaly finish shortly.
-Bengy

Hej Johan,

nice to hear that! (Although it would mean yet another upgrade for NVDI 5.x -
I'm not sure whether Wilfried will eventually upgrade the NVDI for Matrix as
well or not, let's just hope so).

Support up to only 256 colors would be good enough (for the time being...)

I'll keep an eye on the updates, tks for the info.

Hi Harry,

well, old info or not, I fetched the demo of Jinnee, and ran it from my MagiC. Alertbox coming up "fehler im AES" and Jinnee didn't load. I had Wdialog 1.92 or so (the one supplied with Jinnee), threw it into the autofolder and Jinnee started up. Strange, since the docs said "not needed under MagiC"...
>
> l> And once again, I checked with Wilfried Behne about it, and all he
> l> said was "Eeeeeeeeeerrrrrrrrrmmmmmm................."
>
>Strange. He wrote WDialog and is also involved in Magic, isn't he?
>
That's right, he is. At the time I was struggling with my NVDI for Matrix, so I spent quite some time with him on the phone, and eventually asked him about this Wdialog stuff (thinking: if one must know, it's him). The long "errrmm" was his, too :-)
What I know from others is, sometimes you need Wdialog from the autofolder, sometimes it's better to start it from the desktop... the whole lot certainly sometimes gives me the feeling I'm using Schweineprogramme :-)

This upgraded old Atari is becoming a nice Zoo Park: bugs crawling all around, Schweineprogramme that won't do what you'd expect them to do, mice with problems and we're the turkeys supposed to handle it all... glad I haven't got a Falcon :-)

You don't need NVDI for proper HC/TC-mode support on graphics cards!
Or why would you think that other progs have proper HC/TC support for years?
Plain old VDI functionality is sufficient for this purpose, you can
determine the 'display layout' with a suitable algorithm based on standard
VDI functions for proper image display.

1stGuide, for example, has proper HC/TC support since more than 5 years now,
and I never had a TC graphics card on my Atari for testing during
implementation, only reports from users telling me that all works great.
And that was not very surprising for me, since the algorithm is highly
hardware- and even system-independent!

See

http://www.esc.de/homes/guivol/fixpix/

for the algorithm, which is not only universal, but also quite efficient.

Regards,
Guido

Recently retired military and thinning out my 'toy' inventory. All the software titles below are for the 520/1040ST in original boxes with full documentation. Take it all for $40 plus whatever the COD costs will be (suspect around $10), I'll provide the packing material.

1. 'PC-Ditto'....run IBM programs on ST
2. 'Design Ideas' for Timeworks Publisher ST...makes ads, brochures, letterheads, newsletters, etc
3. 'The Essential Atari'....520/1040ST user guide
4. 'MI-Term'....world's easiest terminal program for ST
5. 'Inventory Manager'....a professional inventory control progam
6. 'signs & banners'....design and create signs and banners
7. 'Atari ST Basic Sourcebook & tutorial'...a programming language for the ST puter
8. 'Printmaster Plus'...everything you need to design and print greeting cards, posters, invitations, flyers, calendars, logos, etc
9. 'Printmaster Art Gallery I'...graphic supplement to Printmaster Plus
10. 'Certificate Maker' by Springboard....stating the obvious
11. 'Certificate Library' by Springboard...supports certificate maker...has many templates
12. 'Fleet Street Publisher'...a full-service DTP for ST
13. 'Data Manager ST from Timeworks...Database Program
14. 'Desktop Publisher ST'...full featured DTP

And if you want to check out only certain messages (ie. threads), you
have to do it online. To do it offline, you have to download all the
messages in the newsgroup.

we have been spoiled using the FE for genie atari. :> Not to take
away from Newsie though. This is a very nice program. It's just that
how newsgroups are organized is more general in nature. You'd have to
specialize the atari newsgroups more to enjoy the selectivity we have
enjoyed in aladdin/genie.

At least the user base here is much larger than what genie has become.

Several newsreaders support selective article downloads: you can just get the headers, then select the ones for which you want to fetch the full articles. On the Atari, Oasis2 supports this directly (using ICE or NEWSwatch), Oasis 1 indirectly (using NOSPOP3 or NEWSwatch and Make_get), Okami semi-automatically (using NOSPOP3 or NEWSwatch and OFIND/OEXPIRE - using flags creatively and best done with a batch file).

That's because NEWSie doesn't thread properly (IIRC). It just groups by subject. *Real* threading uses the References line, and the threads stay intact irrespective of Subject changes. AFAIK the only Atari newsreader that does this properly is Okami, though I suspect that MiNTnet ports of Unix newsreaders are fine too. Both versions of Oasis only do subject sorting, like NEWSie.

sounds like hd drivers sys has corrupted,try putting a hd driver boot
sys on the syquest and altering things to suit
or re installing a new hd driver sys on the ide but if this is failing
change it quick

Hi, yes SPIN allows that afaik, or from cdplayer(from a.clauss).
That IF your cdrom supports audio dumps. Mine doesn't support that, so
I never could test. But Many people told me it works.

> pre-emptive multitasking system like for instance N.AES it should
> work.

While you're first bit is true, the second makes little sense at all.
N.AES is no pre-emptive multitasking system, and correspondingly does not
help at all in this situation. What is missing here is MiNT, which you
correctly pointed out further down, but N.AES alone does not solve this
problem.

> I think you'll be better off with a Sting setup. Like Niall says it
> isn't that difficult to get STing up and running.

But then again I of course agree with these replies in that STinG is
the better choice anyway. And if people ever bother to read the docs (the
STING.HYP) they won't have much trouble at all setting it up. 95 % of all
requests for help are explicitly answered in STING.HYP. So if anyone says
he's given up on STinG because he found it hard to set up I can only
suspect he had ignored the docs. In such case I'm not sure if the person
should be on the net because chances are he'll ignore the netiquette too.

I know the docs are rather incomplete, but there are detailed step by step
instructions to set it up, the missing bits are mainly explanations of
details with which the beginner won't need to deal anyway.

Cheers Peter

26. Re: Atari and Amiga Users Unite?

Newsgroup: comp.sys.atari.st
Date: 1998-06-01 00:00:00 UTC
From: jason@zero.abel.co.uk
Message-ID: <jason-0106980108190001@abel-153.abel.co.uk>
Source record: 99817

All of this talk of ST & Amiga users uniting is rather interesting.
Regardless of slight differences in chipsets, the ST, Amiga and Macintosh
all ran on Motorola Semicondouctor 68k chips.

With a few minor adjustments they could actually become one another.

The problem, as I see it, for the ST and Amiga is to follow Apple's lead
and implement the RISC Power PC chips. I hear Amiga Int. ar about to do
this, unfortunately the TOS computers seem to be totally orphaned, apart
from a few VERY low profile Falcon cloners.

If someone produced TOS(or even MagiC) machines cheaply there might
actually still be a future for Atari computers, especially if the use the
PPC G3 or upcoming G4. Alternatively, MagiC could, with the right
promotion or release into the Public Domain become a very good cross
platform OS or even complimentary OS for Macs.

Personally, I have a PPC 603e based Mac, and am an ex ST owner and I would
rather use a decent 68k or PPC machine than any Intel chip. I prefer PPC
because it is RISC, and even the CISC 68k series were and are better than
the x86.

The problem with Wintel PCs is they are, no matter how much they are
kicked forward, still based on a crap chipset. Not to mention what is
probably one of the worst OSes around.

If the ST and Amiga are to survive, a PPC future and some clever coders
porting MAc stuff over and even perhaps writing a few native killer apps
might just do the trick.

Why can't we have PPC "Falcon" running at 266MHz w/ MagiC OS for £599? A
new Pentium 200MHz based Linux machine can be bought off the shelf for
£499.

Or how about a PPC Falcon running BeOS AND Linux?

Here's hoping for the survival of TOS, GEM, AmigaDOS, Workbench, MacOS,
Rhapsody, Linux, Minix, Plan 9, OS/2, BeOs etc...

Hegemoony is NEVER good?

Jason Walsh.

.MSA files are used by the "Magic Shadow Archiver", which is a kind of old
ST equivalent to RAR on the PC, but it came first! ;) The guy that hosts
our website has a page about stuff like that at
http://grelb.src.gla.ac.uk:8000/~mjames/computers/tools.html#Atari16
which has download links to stuff like MSA and other useful things for
archiving on Ataris.

I think that's the multitasking kicking in.
MIDI conversion requires lots of CPU cycle. I am working on further optimising it. I hope to make it faster, & have some success now - about 10% faster.

>I have looked for the GUS patches, A LOTSA them and in ARJ format :/
>

Yes, unfortunately. but the unARJ for ST does work on them very well. It also supports multipart ARJ which the patches are compressed in. I fully recommend that you download and try them. They are a must for MIDI files other than piano pieces (& they are lots of them too).

Rgds
William

For those that need it ARJ.TTP is avialable at ftp.lip6 in the archiver section - and yes it does work very well. I have to second Katherine's praise, Willian has done a good job. AFAIK this is the first player for MIDI files that uses the DMA output for TT's.

Hi there!

Don't blame Joe for delays in translating Thing V1.2x -- if it's anyone's fault, it's mine! Unfortunately it is a /huge/ job and I am spending most of my spare time on it (whenever I am not reading at least some of the thousands of messages piling up here and on Cix). I finished correcting the keyboard shortcuts and making minor changes in the V1.20 RSC as well as translating the THINGTXT.RSC about a month ago and started on the giant hypertext doc (the .STG source is 350+kB and some new images are also needed), but then I was sent V1.26, so a lot of the work needs doing again as the RSCs are different :-(Furthermore I gather V1.27, which fixes a few bugs, is due shortly, so I'll probably wait and go straight to that to prevent repeating it all yet again!

In the meantime I have translated the RSC for the new Thing Icon Editor (V1.10) and am working on the (much shorter!) hypertext for that. As soon as it's finished I'll send it to Joe for release, then return to the Thing hypertext (luckily this is not too difficult to update for minor version revisions). Actually, I am considering abandoning the rest of the translation of the 1.20 HYP and going straight to 1.26/7. I have compared the German sources in Ögale and the differences are relatively minor -- just a few extra functions that users of 1.20 should see at once their version doesn't have. WHAT DO PEOPLE THINK? Can I save time and effort by skipping the V1.20 docs and going straight to 1.26/7?

Please let me (and/or Joe) know. And thanks for your patience!

Regards
/Peter/

This is old information, which was accurate when WDialog was at v1.1x but not since the
version increased to v1.9x. As Peter rightly says, the Print dialogs have been added from
this point.

The latest version of WDialog I'm aware of is v1.98

l> And once again, I checked with Wilfried Behne about it, and all he
l> said was "Eeeeeeeeeerrrrrrrrrmmmmmm................."

Strange. He wrote WDialog and is also involved in Magic, isn't he?

I don't think I found it too hard to configure, but the problems, as someone else said,
seem to be in the area of CPXs - that's what seems to have screwed my entire Internet
connection anyway. As a file-selector it seems fine, but I just can't risk it tbh. When my
system breaks dowwn (as it has atm) ity seems to take me months to work out how to fix it

Yes, same here. But I'd like it to replace my control panel as well as file selector...

t> For some reason Freedom is messing around with the color palette
t> giving me a wrong colored desktop. Also I found that Freedom crashes
t> and alter the timesettings when I try to view everything (*.*) when

Is there any way to set the time with Freedom? It doesn't seem to be a basic part of the system like it is with ZControl...

You don't have to download everything in newsgroups, either, if you use an online reader, such as NEWSie. You can just open the threads you're interested in.

:-)

>The only thing is, I don't want a viewer where I have to change resolutions

MGIF works fine in all resolutions, but I guess you're talking about
the way it uses the whatever mode you have selected instead of switching
to a 'better' one itself.

I've never really felt a need to support autoswitching myself (I run
MGIF in 1008x608x4bit most of the time), but if that's what people want
I can certainly add it. After all, MGIF can already draw in all Atari modes.

>every time I want to use it. Does the latest MGIF even work in Falcon
>high-color mode?

Falcon TC has worked for a very long time (even the last greyscale only
version could handle it).

It does have a few that MGIF doesn't, but then again the reverse is also
true. Smurf also felt rather slow to me, but that might well depend on
what you're doing and on what hardware.

>>can do many jobs for wich I'll have to use Paintshop in Windoze at the

Comparing it with Photoshop doesn't make much sense, though.

>program still sits on my HD, but isn't used at all anymore. Real pity...

Current MGIF versions don't know about 16 or 24 bit graphics modes (except
for Falcon TC), but I would actually have expected the standard VDI drawing
routines (-vdi) to work (but slowly) even in those modes (they would only
show 256 colours/greys, though).

Anyway, now that I know how to check for the display layout (there's a
function for that in NVDI), you can expect upcoming MGIF versions to support
most hardware. I believe NVDI 5 even has built in support for these kinds
of things, so if I get around to upgrading to that before the next MGIF
release, there should be no problem (for users of NVDI 5 that is).

AFAIK there isn't an option to set the time with Freedom. I use D.
Hï¿½pfl's clock.cpx v1.14. A very useful cpx if you ask me. It can be
configurated so that it will ask during boottime for the right time.
This can be useful for these guys without an internal clock.

To enable parity on quantum drives (well mine anyway) you put a jumper
on the pins marked EP. I'm not sure if this will solve your problem
but it might. If its the link 2, i think if you enable parity on one
device you have to enable it on all of them.

Howdy,

Since a week of so I've a weird problem when I use Phoenix 5.0
Sometimes it happens that when I do something inside the database. e.g.
search I get a screen full of these messages:

Pid 71 (Manager): Kmalloc (208) --> (fail)
After a few seconds I can work futher. e.g. if it happened during a search
I do get the results after these messages stopped feeding the screen.

I'm doing this on a Hades 060 running MiNT 1.15.b4/N.AES 1.7.1/Thing
1.26/Nova VDI v2.61 (ET6000)/NVDI v4.11 r7.

Can this been caused by MiNT 1.15? Now I think of it this problem occured
since the day I start using MiNT 1.15.

Hmm...I was going by Karen Ellis's web page, maybe I misunderstood?

(wouldn't be the first time!) ;-)

]-2. I found out the hard way that if all you want is a Mint to run a
]-multitasking AES on, KGMD/KEMD isn't what you'd want. The KGMD/KEMD
]-sets up MintOS, which is a Unix type text-only environment. But if
]-this is what you do want, then great! You've got it!
]-
]-Best of luck to you!
]-
]- Mike Freeman
]- nameerf@flash.net

I've got Freemint setup running AES 4.1, and its okay (at least until I
can actually get my hands on N.AES here in the States), but the problem
is that STing won't work with AES 4.1 under this setup. I can get STing
to work with AES 4.0 but darned if AES 4.0 isn't slower than molasses.

I was under the impression that you could add a line to start up an
alternative AES or desktop (Thing seems to be a popular choice), after
Mint runs. I was looking for a Mint setup, running something like N.AES
/AES 4.1/Thing with MintNet for Internet access... isn't this possible?

Thanks for your reply...! ;-)

Slight differences ???

> With a few minor adjustments they could actually become one another.

Minor adjustments ???

Yeah, change a few jumpers, add a few resistors and you amiga becomes an
ST, right ?

Just because computers share the same processor doesn't make them
similar. You might as well say the PalmPilot is "nearly" an Amiga, since
it uses a 68K too.

>
> The problem, as I see it, for the ST and Amiga is to follow Apple's lead

There isn't one "Falcon" clone yet, and it looks like there never will
be. The Medusa/Hades are TT clones, and so is the Milan.

Amiga Int. isn't what I would call a "High profile" company either.

>

A PPC machine would have no software.

If you're about to create a new machine with no software, why not just
start from scratch ala Next ot Be ?

>
> Personally, I have a PPC 603e based Mac, and am an ex ST owner and I would

Oh, I understand why you seem to have such poor knowledge of the modern
ST world.

> Why can't we have PPC "Falcon" running at 266MHz w/ MagiC OS for ï¿½599? A
> new Pentium 200MHz based Linux machine can be bought off the shelf for
> ï¿½499.

Because prices like that mean mass production! The milan is supposed to
be in that price range with an 040 and PCI slots. What would you do with
a PPC that would have no software ?

>
> Or how about a PPC Falcon running BeOS AND Linux?

Why a Falcon then ? Get a Mac with BeOS .

I don't understand all this crap about PPC. With an 060 and TOS, you
would still have a machine much faster than a Mac with OS8 or a PC with
winblows. Unoptimized bloatware is what makes things slow.

Cheers,
Nick

Well, I only know the first game, and it is are copyrighted. Do not expect anyone to give it to you. But there are a lot of good adventure games written in the past few years, and most of them are freely available on the internet. Infocom's interpreter has been improved upon and there is a competition in adventure game writing.

Check out ftp://ftp.gmd.de/if-archive for lots of gamefiles and interpreters for most platforms. For questions check out the group rec.games.int-fiction.

Also, Last year Activision released a CD with all infocom adventure games on it (unfortunately except the Hitchhikers Guide, because Adam Douglas retained the copyrights).

54. Activity vs Atari

Newsgroup: comp.sys.atari.st
Date: 1998-06-02 00:00:00 UTC
From: s9700212@llandrillo.ac.uk
Message-ID: <6l0ksm$2nh$1@nnrp1.dejanews.com>
Source record: 99745

Does anyone here know anything about a GUI called Activity that was released in 1984. It ran on an obscure portable computer called the ACT Apricot FP.

The computer itself is Intel based, and it runs MS-DOS. However it also runs the Activity GUI. This is a fairly advanced GUI with some amazing features. It features shortcuts on its desktop, with user definable icons. The GUI includes tools to change Icons.

Also it includes a Mac OS style trash can.

Also it includes basic multitasking if used with CCPM.

It is also color if you plug to into an external VDU, which makes it the first color GUI.

The most amazine feature was its built in voice recognition. This allowed you to define "voice function keys" for applications and then control them by speaking into a microphone.

It is clearly an amazing machine, with an amazing GUI.

Does anyone know how it fits in with the history of the Atari ST?

If you have any information I would love to hear it.

Thanks in advance.

Hi Trevor,

the BEST site to visit is
http://www-imk.physik.uni-karlsruhe.de/~gmueller/met.html
It goes straight to an overview of charts available.
I think the main page is at .../~gmueller or .../~gmueller/

I've got all the links directly to the pics to save time, hence the surface
analysis for North Atlantic/Europe is at
http://www-imk.physik.uni-karlsruhe.de/~gmueller/pics/bracka.gif
and the satellite IR and visible pics are at
http://www.meto.gov-uk/satpics/latest_ir.jpg or .../latest-vis.jpg

A 200mb Divergence chart can be found at
http://grads.iges.org/pix/euro5.00hr.gif

If you check at Georg Mueller's page, it lists lotsa links to other sites.

I recall another site in the UK like http://www.come.to/ukweather or something
like that, but I recall the URL has changed. It's probably listed on GM's site.
I recall that one started coming in with a 108 kB JPG, a f...ing waste of
download time, since it was only to "brighten up" the page...

>>these come in as JPG or GIF. Once in, CAB kicks in the viewer to
>>display them, hence speed is important. So Graftool still is my choice, also
>>because it supports lots of formats and the program loads faster than Gemview.
>>
>
>I assume, not having tried them, that all these viewers work faster than

56. United mp3 player effort?

Newsgroup: comp.sys.atari.st
Date: 1998-06-02 00:00:00 UTC
From: Tomas Berndtsson <tomas@nocrew.org>
Message-ID: <yz8n2bw9dcv.fsf@sara.lysator.liu.se>
Source record: 99747
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hi Atari friends!

For those of you who don't know me, I'm aka NoBrain of NoCrew. I was one of the two making the mp2 player for Falcon.

I also started a project of making an mp3 player, by converting from C sources of the amp player. This is however dropped now, for some reasons.

I've heard of a few people also working on, or thinking of making, an mp3 player for Falcon. I therefore have the suggestion of instead of some people trying at their side, we'd try to unite the effort, or at least share what we have done so far, or ideas that we have.

NoCrew has a mailing list running, nocrew-mp3@nocrew.org. This was mainly put up when I was working on the player, and has been very dead for a long time. But, it would be a good place to discuss the development of a player. You subscribe by sending a mail to nocrew-mp3-request@nocrew.org with the subject "subscribe".

Although I can't forbid anyone to join the list (well, I could :), this is what I would like it to be:

Talk about development of a possible mp3 player for Falcon.
_NO_ questions like, where can I get mp3 files, this and that song.
_NO_ mails simply asking how things are going.

I know a lot of people wants to have a player, but few are willing to try to write one. A few things that everyone might not know. An mp3 player on Falcon _will_ use the DSP, so you'd have to be able to program the DSP to make one, obviously.

Alright, this was my idea. Now, all it takes are people who want to join. :) If you know the DSP and don't have anything better to do, what are you waiting for? :)

Comments?

Tomas - tomas[@.]nocrew.org

Yes, I know.
(And even if you do indeed use that VDI function, its really part of
EdDI, which is not dependent on NVDI.)

>Or why would you think that other progs have proper HC/TC support for years?

I've seen a few examples of 'hardcoded' bit layouts, but I'm sure some
people have done it in more sensible ways.
From what has been said in this thread, it appears that even such
modern programs as SMURF have problems, though.

>Plain old VDI functionality is sufficient for this purpose, you can
>determine the 'display layout' with a suitable algorithm based on standard
>VDI functions for proper image display.

Once upon a time I planned to do this (in a way that wouldn't have
worked for cards with Intel byte order, which probably is most of them),
but it wasn't very long ago that I hadn't done anything more complex
than drawing lines with the VDI.

It wasn't too long since MGIF even got a GEM interface, and the very
first windows (only dialogs) appeared less than a year ago.
I'm not earning any money whatsoever from this and therefore I tend to
implement only what I find interesting. Since I don't have a graphics
card (and noone, AFAICR, has mailed me about it), support for such things
haven't been a priority. That said, however, I have now (as in yesterday)
written most of the code for 15/16/24/32 bit (normal and Intel order)
display. ;-)

>1stGuide, for example, has proper HC/TC support since more than 5 years now,
>and I never had a TC graphics card on my Atari for testing during
...
>for the algorithm, which is not only universal, but also quite efficient.

A neat idea, getting bit patterns for the primary colours!
Random access tables are usually not too nice on the caches, but this
should indeed still be rather efficient.

I'll take a look at that fixpix archive later. Perhaps something else in
there is useful.
(I completely agree with you that dithering is necessary in 16 bit modes.)

Actually, for Okami, it depends on the software you use for getting
the messages from the net. What you say is true for SLIP/PPP programs,
but Okami can also be used with UUCP and SOUP. With UUCP you can get
headers only as well (AFAIK), and then select the messages you
actually want to download, and the same goes for SOUP, if the software
for making SOUP packets on the host end is UQWK.

Greetings!

Getting ready to move and need to start clearing out my unused items. I've never managed to get around to finding software and stuff for this so much as I hate to say it, time to say bye-bye!

Atari 520STFM in perfect shape cosmeticaly and functionaly. With manual and an Atari CX77 Touch Tablet (which came with it and seems to work though I'm not sure it's intended for an ST). Sorry, no mouse, software, etc.. Does have a TV adaper box and cable.

I've been trying to follow the newsgroup for an idea on price but haven't really seen much so I guess I'll just let it go to the best reasonable offer.

Thanks and please reply by email not in the newsgroup,

Kevin King

Those developers don't care to get it right, as I see it (others got it,
and these could have been contacted).

> written most of the code for 15/16/24/32 bit (normal and Intel order)
> display. ;-)

The good thing with fixpix is that you need only *one* routine for each
common bit depth (16, 24, and 32 - note that 15 is automatically handled
by the 16 routine), and you don't need to care about bit- and byte-orders
(and can get away with corresponding shift and mask operations).
See the given xv code (X Window system) for a practical example.

> A neat idea, getting bit patterns for the primary colours!
> Random access tables are usually not too nice on the caches, but this
> should indeed still be rather efficient.

The most important aspect for me is the hardware-independence.
BTW, for palette-type images ((X)IMG with 256 colors or so) I use a
different scheme, building up tables for the pixel values as pointed out
in the screen_init() function directly for the given custom-palette
instead of using the separated RGB-tables. I already used this method
before supporting TC-source images (e.g. JPEG) to render color palette
images in HC/TC, and kept this now as special case. You could also
render palette images with the global RGB-tables, but the other method
is still good (and in some respect advantageous) in this case.
On the other hand, it would be quite inacceptable if you reduced a full
color (JPEG) image down to 256 colors and then render this with the
palette-method in TC. Horrible idea, while the direct RGB approach
is quite effective and appropriate.

> (I completely agree with you that dithering is necessary in 16 bit modes.)

The given Floyd-Steinberg approach retains the hardware-independence of
the basic fixpix method and gives quite satisfactory results.
On the other hand, I've also seen Ordered Dither schemes in this case
which look amazing in comparison, but lack the universality of the FS
approach (need adaption to the actual bit counts).

Regards,
Guido

>(h=minix). But if I just browse drive h: under N_Aes window,
>I access all directories and files in the minix partition.
>
>Any ideas why I can't get Connexion to find the needed files, or why
>tcsh won't let me to other directories?

My experience is that I couldn't use Connexion when I was using a
MiNT/mintnet setup created by the TAF-package. Recently I re-installed the
whole thing but now with KGMD (and KEMD). No problems anymore to use
Connexion.
The only problem I've is that I get /dev/log: file not found warnings.
It seems do to not harm however. If anyone has an idea about this I'd be
glad to hear.

The Amiga custom chipset would require more then a "few minor adjustments",
the 68k in the older Amiga's didn't act as much more then a support chip
for the custom chips.

> The problem, as I see it, for the ST and Amiga is to follow Apple's lead
> and implement the RISC Power PC chips. I hear Amiga Int. ar about to do

Amiga Int have dropped the Power PC chips like a hot potato. They are
actually going with a totally new chip that isn't available yet, sourced by
Gateway.

> this, unfortunately the TOS computers seem to be totally orphaned, apart
> from a few VERY low profile Falcon cloners.

> platform OS or even complimentary OS for Macs.

Mac OS in it's present form is a mess. Not much better then Windows95. No
pre-emptive multithreaded multitasking as yet, unlike Amiga OS (since 1985)
and Win95 (if it doesn't crash).

> Personally, I have a PPC 603e based Mac, and am an ex ST owner and I
would

Agreed, I have always viewed Motorola CPU's as superior to Intel and clones
(although AMD are on the right track).

> The problem with Wintel PCs is they are, no matter how much they are
> kicked forward, still based on a crap chipset. Not to mention what is
> probably one of the worst OSes around.
>
Chipsets aren't the problem, they are quite good, but the basic system
architecture is a dog's breakfast. This will change with the introduction

of the Merced chip from Intel I believe.

There is more then one PC operating system, Linux is far better than Mac OS
for instance, but it doesn't suit everybody.

> If the ST and Amiga are to survive, a PPC future and some clever coders
> porting MAc stuff over and even perhaps writing a few native killer apps
> might just do the trick.

Amiga & ST, not the same league. PPC Amiga's are already available as both
upgrades to old systems (A2000+) and new machines. Developer machines will
be made available to software developers in November 1998, available
through Gateway.
New OS4.0 and OS5.0 already announced, Netscape and Opera being ported
right now for current Amigas (not to mention the other excellent Amiga
browsers), ICQ in development, new imaging packages have been released,
etc...
Things are looking up for the Amiga. Perhaps port Amiga OS to the Mac?

> Why can't we have PPC "Falcon" running at 266MHz w/ MagiC OS for £599? A

The more alternatives the merrier. Monopoly = Monotony

> new Pentium 200MHz based Linux machine can be bought off the shelf for
> £499.

Pretty minimal system by todays standards. Linux makes it useable though.

> Or how about a PPC Falcon running BeOS AND Linux?

Windows95 ? (just kidding) :-)

> Here's hoping for the survival of TOS, GEM, AmigaDOS, Workbench, MacOS,
> Rhapsody, Linux, Minix, Plan 9, OS/2, BeOs etc...

The more the merrier.

> Hegemoony is NEVER good?
>
OS/2, pobably the best thing IBM has brought to the PC market. A good
allround OS, superior to Windows in every way.
At least they tried...

Regards,

Clockmeister.

HS> the programs themselves?

I have a few translations on my web site http://www.cix.co.uk/~derryck/

I will be posting the English docs for Julian Reschke's Spin! CDROM driver
there in a day or two (the next release is slated to include docs in English
but there is no timescale available ATM).

HS> Is there a TransAction web site at all?

I believe that there is one, however I don't think that there is anything
there other than a brief profile of the team.

It's all too easy to lose sight of translated work if the original author has
disappeared from the scene or whatever, so I'm anxious that stuff such as the
hard disk driver CBHD - already translated - doesn't disappear into limbo but
again I'm afraid of stepping on toes.

Speak to 'ya later!

s> What would prevent a SCSI hard drive working with ANY other SCSI
s> device?

The usual problem is termination - only the last device in the chain should be terminated - or SCSI ID clashes.

As for parity, assuming that the host adaptors you've tried support it (ICD's Link II, Link 96 or 97) then that shouldn't matter.

If the other drives cannot have parity disabled and you're not using a parity-supporting host adaptor then there is a text file describing how to make a parity bit generator on the web somewhere, I'd take a look at Jo's UTSI site for starters.

c> Hallo Peter,
c>
c> I Surf all the time with CAB in TrueColor with no problems. Here's

My experience (a similar setup to yours but using a Screenblaster and
Videlity) is similar to yours - I can surf and download quite happily with a
serial port speed of 115200.

However I can expect errors when downloading message packets from CiX using
ZModem (gszrz) so there is a problem which appears to be hidden.

I tend to use a mono res of 736*560 for the majority of my work, there is no
problem then.

BTW, the Videlity software allows you to access TC without that HRTC auto
folder patch, and if your monitor will allow it you can boost the res up from
640*480.

Hi David!

d> Organization: I wish!!!

d> As a side issue to this, anyone know how to get CD_Player 1.4 to
d> recognise and play audio CDs on it. I've tried CD-TEST.TTP (from

The usual cause of this is that the CDROM player isn't compatible and won't
respond to the "play audio" command from Spin! (V0.34 is the latest version
BTW).

You might try Extendos Pro as that seems to offer better compatiblity,
although you'll lose LFN and background DMA support.

HTH.

Atari Computing issue 9 announces Mark Wherry's GEMTrade, a modern version of
the original Ruftrade - full MagiC drag'n'drop etc etc.

Anyhow, the module plug-in for CAB means that it will translate Web pages
online for you, the quality of translation looks (from the screen shot)
similar to Ruftrade's.

GEMTrade is shareware, download it from http://www.cix.co.uk/~mark_wherry/

<snip>

Not too sure about running Amiga programs on the Atari, since quite often, games hit the custom chip hardware directly and might require quite a bit of work to translate to the Atari's graphics. Utilities might be compiled to the Atari more easily, since these usually are mostly designed for various Motorola processors and graphics chipsets.

Can't be too dificult though, since versions of games AND productivity stuff used to appear on both machines, eg Batman the Movie, ST Dragon, Chase HQ, Turrican and serious stuff like Protext etc. (Sorry, that's all the productivity software I know that was definately on both machines.)

85. TAF MonSTEr Flea Market July 11th

Newsgroup: comp.sys.atari.st
Date: 1998-06-02 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <35748f80.0@diana.idirect.com>
Source record: 99776

SATURDAY, JULY 11TH, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 1:00 PM and will remain open until 5:00 PM.

This may be your 'last chance' to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

Not only is this an opportunity to buy or sell hardware and software for TAF members and other Atarians, this will also be an event whereby you can learn what you can still do with an Atari, including the Internet, Desktop Publishing, Scanning OCR, MIDI, and much, much, more! There is a confirmed Internet Demo (using the suite of available Internet prgs. running under STiNG), Howard Carson of MGI mentioned that he would be showing Calamus SL-98, and Martin Nueland will do a MIDI demo.

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

We are anticipating a good turnout and hoping to have some dealers at this event and thus TAF has booked a larger hall to accomadate everyone. To help defray some of TAF's costs of the event, the following will apply:

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admision is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is included. Admission for TAF members is, of course, Free.

The Flea Market will run from 1:00 PM to 5:00 PM, with setup commencing for sellors after 12:00 PM, noon, and teardown after 5:00 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Gold Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge.

Parking garage inside the complex - enter next to the Novotel Hotel on Parkhome Ave. Those comming by public transport can take the TTC's Yonge Subway, North to the North York City Centre Station, then walk through the tunnel into the concourse, down to the food court, turn left and find the Memorial Hall on your right.

Saturday, July 11, 1998, 1pm - 5pm for the TAF "Flea Market. To contact TAF on booking a table or tables:

86. TAF Meeting June 17th - ExtenDOS Gold and More!

Newsgroup: comp.sys.atari.st
Date: 1998-06-02 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <35748f8d.0@diana.idirect.com>
Source record: 99777

Agenda for the June 17th Toronto Atari Federation meeting:

well, before we go off for our summer hiatus, we want it to go off with a BANG! And what better way than with a club exclusive!

For tonight is when we host Roger Burrows of Anodyne Software, the man responsible for developing the first practical driver for utilizing CD-ROM drives for Ataris, ExtenDOS. And at this meeting, Roger will be unveiling two of his new products: ExtenDOS Gold, the logical upgrade to ExtenDOS and ExtenDOS Pro which supports more drives than before as well as adds some new features, and CD-Writer, a practical and low-cost application for buring your own audio CDs using a CD-ROM read/write drive. He'll also be offering upgrades for existing ExtenDOS users at the meeting.

As anyone can tell you, having a CD-ROM unit attached to your Atari adds an added dimension of having lots of media, text, and software archives with miminal storage space required. If you haven't yet hooked up a CD-ROM unit to your computer, or have ever been curious on what a CD-ROM can do for you, by all means come to this meeting.

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. at Parkhome Ave. Parking garage inside the complex. Those using public transport can take the TTC's Yonge-University-Spadina line to North York Centre Station. Meetings start 7:30 PM, $2.00 to non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. A membership in TAF IS Atari support!

Here is a list of software that I still have for the 'ST. If interested
please e-mail me at: nermal@magicnet.net

Software with original disks and documentation:

ANTIC SOFTWARE:

STAR STRUCK the astrologer (will load and work from a hard drive) $5.00

Maps and Legends the Cartographer (only runs on old TOS) $3.00
Data Map Collection 1 $3.00 $5.00 for both.

CyberPaint (Pro Animation Studio) from Antic Publishing, Inc. vs. 2.0 and 2.1 manual and disks are in very good condition $15.00.

CAD-3D (version 1.0) [all 3 resolutions] no original disk $1.00

HUMAN DESIGN DISK (Requires CAD-3D) $5.00

GENESIS - The Stereo Molecular Modeler (StereoTek Option) $5.00

FUTURE DESIGN DISK (Requires CAD-3D) $5.00

Fonts, Primitives, Hints and Tips (Requires CAD-3D version 1.0 or 2.0) $5.00

3D Developers disk for CAD-3D 2.0 $5.00 print out the read-me file

CyberSculpt (Antic publishing) for use with CAD-3D $5.00 Print out the read-me file.

CyberTexture (Antic publishing) for use with CAD-3D $5.00 Print out the read-me file.

Spectrum 512 ST0249 disk: print out the read-me file. $5.00

CAD-3D Collection Antic publishing $5.00

Architectural Design Disk by Darrel Anderson (Requires CAD-3D) $5.00

Flash STO220 by Joe Chiazzese and Alan Page (telecommunication package) [medium and high resolution] $4.00

The New Technology coloring book (low resolution only and only works with the old TOS) $2.50

GFA Artist by Michtron all 512 colors in resolution on your ST manual and both disks $12.00.

First CADD by Generic software manual and disk (early printer drivers included including CGP 220 and Epson). $12.00.

WANDERER by Pyramid Software includes two (red/green) stereo glasses. Case is in very good condition #12.00.

1st Word with manual (versions 1.01 and 1.02) $1.50 plus shipping

Fahrenheit 451 by Ray Bradbury (Telarium) originally sold for $49.00 paid $30.00 yours for $10.00.

HabaWriter (reported to be the worst word processor ever for the ST!) It ran properly on both of my systems! Box is in fair condition $1.50 plus shipping.

THUNDER! spelling checker (Batteries Included Software) for word processors without a spelling checker. Works better than the spelling checker that was part of 1st Word plus No box but does include the Batteries Included catalog. $10.00

Oo-Topos for Atari 520ST by Polarware (missing the ships map) $5.50.

The Crimson Crown (further adventures in Transylvania (Polarware) box is in very good condition and includes the poster. $10.00.

Temple of Apshai Trilogy by Epyx. Box is in very good condition and includes the registration card. $10.00

TASS TIMES in Tonetown (Activision0 box in very good condition. $10.00

Hacker II the Doomsday Papers (Activision) box is in near mint condition $10.00

Mercenary and SECOND City Disks (Datasoft) Includes the registration card. $15.00 box is in fair condition.

Silicon Dreams (Firebird) $15.00 case is in near mint condition and includes the registration card.

Jewels of /Darkness (Firebird) $10.00 case is in near mint condition. Includes the registration card.

Flight Simulator II and Japan Scenery disk. (Sub Logic) only runs from disk Color version. $15.00

Revolver (Intersect Software) load two or more programs on a 4 meg system. Requires a minimum of one meg of RAM. Complete with manual and disk. $10.00

COPY II ST a back up program for the ST and will back up most protected programs. Manual and disk $8.00.

Word Perfect including docs and last set of disks. $25.00

Dennis,

I'd recommend a book called HTML FOR DUMMIES.

While it's not the absolute best book on the subject, it is a good
starting place.

There are also two programs available to help you compose the pages
without needing to know how to code in HTML. They are HomePage
Penguin, and WebPage Creator.

Neither of them is as all-encompassing as what's available on the PC
platform, but they too will help you get started.

I can email you either of these programs if you wish.

Take care,

Joe Mirando @ STReport

> started even if it's a reply to another thread and should be grouped
> there. :-/

Nope that's wrong. Threading is based on the References line in the header,
even if the subject is changed the thread linking is done. That is, if the
poster used a proper news client. Unfortunately, there are many people here
using news clients which damage the References line or do not include it
in the first place. Net2Net is one of those, STarBox another. NEWSie 0.88
has such a bug too, I don't know if it's fixed in V0.90.

At least CD Digital Audio 2.10 (by Julian F. Reschke) and CD Player V1.4a 11/96 (by Alexander Clauss) seem to work fine with my Toshiba XM-4101TASUNSLCD3424.

Both programs play CD's and read raw audio data from CD's just fine with both, CD Tools and SPIN! drivers.

One thing that my setup failed to do was accessing the 'track*.wav' files that are shown when I list directory of an audio CD. Tried to copy them and converting them with sample converter but audio data loses its sync while being read.

Hi Ken

I think the part Terry is missing is that "treading" only works while on line. I find it much faster to just down load everthing and go thru it all while off-line. The Genie forums, in addition to being nicely grouped where also well moderated so that non-group messages were moved to the proper group. If a person persisted in posting to the wrong group and could not take a "hint" the messages would be cut.

Steve

An alternative would be ExtenDos Pro by Roger Burrows. I have had it for
some time (using a NEC 3X) with not problems at all. This is with a
TT/Nova graphics card and MagiC 4.0.

105. net problems under Mint/Aes

Newsgroup: comp.sys.atari.st
Date: 1998-06-02 00:00:00 UTC
From: miitervo@jypoly.nospam.fi
Message-ID: <35738c6d.88627179@news.inet.fi>
Source record: 99828

Hi,
I have came across with some problems in getting dial up
networking to work under Mint/N_Aes/Thing. Pppd works
fine under plain console (no AES), but under AES I get problems.
I have tried to establish the connection with Connexion, but whenever
I use it it gives an error.

/pipe/log : file not found

for all files it tries to access. Also if I try to use tcsh shell
under Aes, I can't get to any other directories than /h/usr/bin
(h=minix). But if I just browse drive h: under N_Aes window,
I access all directories and files in the minix partition.

Any ideas why I can't get Connexion to find the needed files, or why
tcsh won't let me to other directories?

I had this same problem to start with. This is probably not the best
way to do it, but the way I've found that works is to invoke
"sh /etc/rc" before kicking off your PPP daemon. Note that you'll
probably want to create a special version for AES which does -not-
start up virtual consoles.

Can't help you with the rest. I use tcsh with no problem (but with
just plain ol' AES).

"Teach Yourself Web Publishing with HTML 3.0 in a week" second edition
by Laura Lemay -Copyright 1996 by Sams.net publishing
ISBN 1-57521-064-9 $29.95 US

Covers HTML 2.0, HTML 3.0, Netscape and internet Explorer extensions,
and CGI.

It's an excellent book. Clear, consice, well organized. So far I
haven't found anything it doesn't tell me how to do (with just a text
editor) except for frames. I bought this book well over a year ago, so
I wouldn't be surprised if there is a third edition that covers frames
as well.

On another note, does the spam software look for e-mail addresses in
the header only, or is an e-mail address in the signature susceptible
to being picked up as well?

IDE drives should not influence SCSI drives. Did you try a newer version
of HDDRIVER, i. e. the demo version of HDDRIVER 7.5? 4.6 is very old,
the current demo version is available from
http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html

That's very unlikely. If the driver file is corrupt it won't work at
all, you wouldn't even be able to boot in this case.

Look for books authored by Laura LeMay! She is the
absolute best, because:

1) she adheres to standard usage,
2) she provides sufficient depth to make your pages special, and
3) she's somewhat suspicious of computers, and it shows!

Her "Teach Yourself Web Publishing With HTML in one week"
is already an out-of-print classic, superseded by a similarly
named tome that teaches all of HTML 3.2 in TWO weeks.

Don't be tempted by books "edited" by Laura LeMay -- get
the one "authored" by Laura LeMay.

-- George Crissman
-- strads@tmisnet.com

Go gettum, Dennis!

the /pipe/log is probably because when you boot, the syslog daemon
didn't have enough time to create everything, and the next prog run
directly after., Look in your /etc/rc file
and add that right after the syslogd init part
sleep 3
Then here you should have your cron daemon.
If you don't have enough time betweem,. you'll most likely experience
the /pipe/log prob :)

As for the pppd connection, well 1) make sure pppd by itself works
fine. from the aes run it from a shell.
like, run bash into toswinII then make sure your user is either root
or in the group 'wheel'
2) what mint version do you have? also, could you make a dump of your
mint setup with the program "MiNTsetter 2.6" ?
I never used connexion myself, faster for me to type pppd than
launching connexion etc.

You can replace the connector, but just write down which coloured wires go to which pins before you find yourself with just a bunch of coloured wires in one hand and a disconnected connector in the other.

Sources for Atari 13pin DIN connectors are various. Try Best Electronics, or B&C computervision. In Europe, Radiospares and Conrad Electronics also have Atari connectors.

Cheers,
Nick

Try CDPLAYER v1.4, John.

I have been trying this with my 1995 2x IBM CDROM. I fail because this drive does not have Direct Data Sampling (I think this is what it's called) which is necessary for this sort of transcription.

Heavens, NO! I guess you mean that the wires are starting to detatch
from the plug shell.

You could just take it to bits, cut off about an inch of cable,
resolder and re-assemble the shell.

If the shell itself is in a bad way you can find 13-pin DIN plugs
fairly easily. Do you have access to a Maplin's shop - they certainly
have them.

Whatever your plug looks like at the moment you only need about 6
wires to suport RGB - you can forget the rest.

>Is there a software fix that can correct for programs that roll on a 50
>Mhz monitor because they were meant to output to a 60 Mhz monitor? The
>program "GO5060" bomb on me when I do a reset. Any other options?

I'm guessing your in the US... Hi there :)

Short answer: Try tweaking the vertical sync (hold?) on the monitor...

Longer answer: What monitor are you using? What model 'strange grey box'
for that matter... :) Both my SC1224's work fine in 50hz mode, but who
knows, yours may need a tweak... Or are you using a TV? (yuck... :) I used
to often hook up my STFM to various TV's for gaming. (MidiMaze lives!) But
of course most American TV's don't like 50hz much. A slight nudge to the
vsync always worked for me. Though on at least one, tweaking the knob just
right to keep sync with Atari 50hz and 60hz, and* regular TV broadcasts was
a bit tricky...

As far as software goes, switching the refresh rate is got to be one of the
simplest things to write... :) Just for fun I once wrote a lower border
overscan thingy in pure GFA basic... I don't know what go5060 does exactly,
but I don't know why it would crash your machine. Blame it on something
else... :) If you want I'll email you the hz toggler I have. Its only 145
bytes... (I think I found it on Umich...) Or if your running games/demos
that load from bootsector, look for DCbootit. (Umich :) It works great for
getting that darn "Froggies over the Fence" demo to run... ;P

I second this idea. Brilliant!
My Stacy *is* good, but a laptop version of Milan with a 800x600 active
matrix screen (256 colour or better) would be really great.

I mean it!!!

There *is* a need for a TT/Falcon laptop that can run MiNTOS and N.AES.

I'm not kidding.

I tried requesting an ISDN line, (I wanted to register a domain and
remain online 24h) but I was told by the phone company that my "PC"
needs an ethernet card, so it can connect into their gizmo.

Then again, maybe the phone company's customer service reps confuse
ADSL and ISDN...

Sorry, but if we want to get even minimal support from Steinberg, it
won't be by giving away cracked copies of cubase. Besides, crakced
versions of cubase won't be any more stable than your PC stuff.

Don't you get the feeling that you would be screwing the guy who's
trying to sell his stock of legit copies at ï¿½300 ?

Get yourself a freeware MIDI file player from ftp.lip6.fr or another FTP
site, and don't ask for pirate software on public forums.

Cheers,
Nick

I didn't mean to shoot down your dreams, but you still have to be realistic. You often hear people say: "Hey, why not get a Falcon, put a PPC in it, PCI slots, SIMM memory, recompile TOS, and presto, you have a killer machine". It's not that easy. It's like everybody getting excited about the Wizztronic clone that is only a bunch of specs at the moment. I have an idea what electronic design is all about since I happen to work in that area, and I can tell you that it takes money, time and ressources to do stuff like that. Doing a PPC clone would be as difficult as designing a whole new computer. NeXT failed at this. Be failed at this. Even Amiga Int. has also gone software only. I just can't see how small companies all alone could build a killer PPC machine from scratch.

Then you have the software issue. Even if you port TOS to the PPC (or more likely some flavour of MagiC), you still have a ZERO software base. Believe me, PPC is not the way to go. Coldfire maybe (even then), but not PPC.

> The person may not be technically 100% correct but the idea behind what he

Why not? When you post to a group, you have to be prepared for someone to say that what you said is crap. It's tough, but that's how it works. I apologize if I offended anyone.

> This is not a perfect world.

How true.

>
> I found it ironic that you ended your cynical reply with the word "cheers".

Sorry that you took it for irony. I always thought that cheers was a little friendly note, on what is generally considered a friendly newsgroup.

I must admit that I found more cynical for Jason to give his "cool new ideas" about a PPC Atari, and then in his next post ask for pirate software for his PC emulator.

Actually I once had a cracked version of Cubase 2.x when I still used
a ST and it was rock solid. It _NEVER_ crashed and was even more solid
than the real thing as the problematic dongel wasn't necessary.

You guys should send Gerhard Huber an e-mail requesting the specific NOVA driver needed. He was kind enough to send me 2.66 and 2.67 for the Mach 64. At first he may tell you to visit their BBS in Germany, so a little on-your-knees 'pleading' won't hurt <g>. In an initial attempt to get 2.67, I did make an expensive visit to the BBS but had no access to the VDI file area anyway.

Actually, while Amiga International is simply a sales and marketing company, Amiga Incorporated is developing new hardware. And the parent company, Gateway 2000 is hardly small fry in a big pond.

That's not to say that software developed for one machine could be recomplied for another. For example, a program wriiten in a C variant or 68k assembler could be converted from the Amiga to the Atari without too much difficulty. Software houses used to do this all the time, either for games or applications. Hell, they used to take the best Amiga games like The Chaos Engine, Zool, Cannon Fodder and Zeewolf and port them to the Sega Megadrive! It works both ways, since Desert Strike/Jungle Strike on the Sega was ported to AND improved on the Amiga.

The problem is that even a "fast" CPU as 32MHz 030 is too slow for mp3 decoding. The FPU surely helps a lot, but still not enough to be able to do it in realtime. There are some ways to make the decoder much fast, if the quality of the sound is reduce significally.

Although optimization for CPU/FPU and DSP assembler are quite different, you're probably right in that development of both can take advantage from each other. You're free to try ;)

True for games, but as soon as you start using the machine's GUI it
becomes more difficult to port directly from one to the other, and the
future is in those serious apps, not games.

Cheers,
Nick

Basically, the custom chips are dedicated processors for sound, graphics, etc. In 1985, the Atari ST had a Motorola 68000 running at 8mhz, which as I understand it, handled the data, input/output, sound and graphics. The Amiga 1000 had a Motorola 68000 running at 7.14 mhz, BUT, with the custom chips to handle everything apart from actually running the code of a program, the Amiga actually had a speed advantage over the ST. With the data spread over several (then) advanced chips, with a dedicated purpose, the Amiga had an Advantage over the ST for performance, despite higher prices for both hardware and software.

Not to say that I think Atari's are cruddy computers, though. Any non-Windows machine is OK in my book. ;-)

They used to produce apps like Protext for both machines though. Still, the GUI's of both the Amiga and Atari have had various add ons to the original environment since then. Amiga has Magic User Interface, Magic Workbench and New Icons. the Atari has Magic...erm...and loads or other things. Probably. ;-)

The Amiga has several mp3-players, a few of them even works in
real-time on 14MHz 020. Sure, the sound-quality isn't the best, but
I'm sure that one of these players can be converted to a 030-Atari.
Not that I want to do it... ;-)

Actually, one of the guys who designed the Amiga custom chips also designed the chips for one of Ataris 8 bit machines (800xl, I think Just before the ST at least.). Anyhow, the machine did great money. The team were gettting ready to work on a 16bit system and Atari sacked them, thinking they wouldn't need them any more. Shortly after, they designed the Amiga chipset and Atari (ie Jack Tramiel) live to regret it when the Amiga emerged as the more powerful system.

The Atari got screwed, Amiga got screwed, etc, etc. Uncle Bill has embraced the world with his nightmare vision. Och well.

I am not an Amiga specialist, but I read sometiem ago through the
Amiga hardware specifications as I was working on a .MOD player.

From what I remeber the Amiga has a soundchip doing 4 channel
DMA digisound, using DMA, the replay frequence isn't fixed like
the STe's but for every channel programmeble. Every channel has
its own volume control. The whole 4-channel .MOD format was a
set of values that could be used directly for the Amiga soundchip
registers.

The graphics hardware is much more flexible than the ST's and even
STe's. It has bitplanes too, but they are not interleaved. It is
possible to use overlays. The display colors can be updated on
any adres using DMA loading.

Last but not least the machine has a blitter that is quite powerfull.

For more and exact informations you have to ask an Amiga guru.

Hans

> >Is there a software fix that can correct for programs that roll on a 50
> >Mhz monitor because they were meant to output to a 60 Mhz monitor? The
> >program "GO5060" bomb on me when I do a reset. Any other options?

Program to switch form 50 to 60 Hz and back in C:

#include <tos.h>

void knal()
{
*(byte *)0xFFFf820aL ^= 2;
}

int main(void)
{
Supexec(knal);
return 0;
}

Same thing is assembly:

pea knal
move.w #$26,-(sp)
trap #14
addq.l #6,sp
clr.w -(sp)
trap #1
knal:
moveq #2,d0
eor.b d0,$ffff820a.w
rts

Do it in basic (Gfa)
spoke $ffff820a,speek($ffff820a) XOR 2
(Not 100% sure about this one.)

Note: all three not tested but should work.

Hans

Hello!

I just had a very strange experience. I've never used IRC before, so I thought I'd give it a shot. I saw in a post here, the server irc.funet.fi, so using AtariIRC with STiNG, I typed "/server irc.funet.fi", and when it looked connected, I typed "/join #atari". I waited a few seconds and suddenly it said, "You are not welcome on this server: ^OAbusive Host". What does this mean? Did I do anything wrong? Are my settings possibly incorrect? What should I check to make sure my settings are right? Thanks!

>Will Notator 3.21 and a NOVA graphics card (Mega
>STE) work together?
Well, it depends on what you call "work". I just had a check to be sure:
- it crashes in every color resolution,
- the main page works in 640*400, 640*480 monochrome (above, the display is a total mess), but there is no benefit in it, the amount of information displayed is exactly the same. It is not possible to acess Edit (i.e., the score) in these resolutions. These resolutions, although limited, could be useful to quickly check or play a song without having to switch to emulation (RESWITCH.PRG can do this automatically),
- it works fully with the mono emulator provided with NOVA drivers (of course, with this emulator, the display is a little jerky). The only benefit I can see in this is to avoid switching screen.

Hope this helps,

157. The CD-ROM Drive Saga!!!! Continues:(

Newsgroup: comp.sys.atari.st
Date: 1998-06-03 00:00:00 UTC
From: steve@steverosie.demon.co.uk
Message-ID: <896896906.17245.0.nnrp-07.c1ed1184@news.demon.co.uk>
Source record: 99725
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm still having problems connecting a CD-ROM drive to my beloved STE:((

I haven't until the last few days or so, been able to test the SCSI device (CDR) with another hard drive; this was a power computing SCSI. I am getting exactly the same response as I did before; Hard Drive failing to boot and the HD structure not being recognised correctly (760+meg of used data on a 127 or 52 meg HD!)

I have now able to try them connected to a PC, and they work in perfect harmony with each other.

The HD's are a MiniS 127meg, using a Quantum LS127S which has internal terminator, easily changed ID and has the parity switched via software (or so the ICD info tells me) and the ICD software claims that parity is disabled! The other HD is Quantum 54meg drive, fixed ID=6 and internal terminators.

The CDR's is an Apple CD300 with a Sony 8003A machinism, easily changed ID and no internal termination. The other mechanism that I've tried is a Toshiba XM-3301B.

The DMA-SCSI adpators that I've used/tried are: ICD Link 2, Translator as supplied from System Solutions with the MiniS HD and the one supplied with the Power Computing HD.

I have also tried it on at least 7 different ST's: 2 x STE's under 1.62, 2 x STE's under 1.6, 2 x STFM under 1.2 and 1 x STFM under 1.4.

One 1.62 and both 1.6 STE's were 4 meg, the other 1.62 was tried with all possible memory configurations. One 1.2 STFM was a 1 meg and the other 1.2 & 1.4 are 1/2 meg's. And finally I have also tried under 2.06 on a 1.6 & a.62 STE's with 4 meg.

I have used the following HD drivers: ICD v6.5.5, HD Driver v3.1, HD Driver 7.1 Demo, GBHD v5.02 and a German one. The CD driver tried are Spin v34, Extendos Pro and MetaDOS 27.

I have checked for the following: clashes with ID numbers, removal of internal terminators and soley relying on external (i.e. on the end of the chain), also every possible combination using both internal and external terminators. All devices work with each other with NO problems on a PC.

Because they are working on a PC makes me believe that I've done or am doing something wrong! All I want is to get the #@*&~%# things working

with each other, before I crack up.
Cheers! for now
Steve

Not sure about the ur-ST, but all the models I own have support chips for
video, sound, DMA, keyboard, etc.. Maybe the A1000 just had better ones
or a better bus architecture ...

Ditto, also the same effect seen with Freedom (V1.15) if I've another prog
running in the background - it seems that the copy process that occurs before
a purge sometimes gets the directory of the other prog as a destination.

HS> It's got some excellent features but I haven't been happy with any

A very good (free) one is the SelfHTML compendium of Stefan M�nz. It�s in German, but it�s the Web version of a printed book (so not one of those three-pages-how-to-learn-HTML you find on the web massively). Also JavaScript, CGI/Pearl and CSS are explained in it. But attention, the ZIP is about 1.5 MB!

Here goes:

1.) Where can I get the in-depth info on the 1040STf?
2.) Can support chips for the 1040STf still be had?
3.) What is the max memory the 1040STf can have, in the memory map?
4.) If a 68000 embedded processor was running, the 68306 for
example, at 20MHz, would existing software not run?

Just the start...

The abusive host error means that the server you contacted thinks that you've been on before and been a nuisance and got banned!! From your post I assume you haven't. In some way your config matches that of a known list of unwelcome visitors - perhaps your IP or nickname. Don't change anything your end, contact the sysop of irc.funet.fi and tell them what's going on ... all just a harmless case of mistaken identity I'm sure!

Well, somebody was right, this not a piece of mirror writing, but a
message in Polish. It translates (roughly) as follows:

"Where can I find games for Pacifist in the form of packed "*.st" files?
There are a lot of mentions of these files on the web, but I cannot find
the exact addresses. If somebody can help me, let me know".

you can do it w/o spending a penny ... html is an open protocol and it is very well documented on-line ... if you don't need too much spoon feeding and can work from 'reference' like texts then its all out there ...

unsurprisingly there is loads at microsofts site and netscapes site, i prefer the latter and they have a full HTML4.0 reference to download ...

i'm not sure how CAB is dealing with these sites thesedays ... you might have to use a pc (internet cafe) if CAB aint happy with all the bells and whistles ...

i can email you the HTML4.0 spec if you like ... 984Kb ... simple HTML, CAB will be as happy as larry

... good luck!
oh and viva atari /|\

Source record: 99787

'525' is the bees-knees for this, its shareware too :) 'Zero-x' is excellent too and does a bucket-load more than just conversion - imagine Soundforge/Wavelab/Recycle all rolled into one :))) but is comm, costs 180ukp.

They probably 'sound funny' on the FM because the audio hardware cannot playback at the original frequency.

i think CAB should be bundled with the Milan and marketed as a low-cost
but powerful internet solution ...
micro$ monopolistic image should be play on to the full ... buy Milan
its European, make it chic ... aim it at the few (but healthy!)
remaining Atari users and then flog it at the millions of people who
don't yet have any computer at all ... the largest market surely?

David and Goliath ....

Jim

177. i need cubase desparately...please help.

Newsgroup: comp.sys.atari.st
Date: 1998-06-03 00:00:00 UTC
From: antispam.sigma_delta@hotmail.com
Message-ID: <antispam.sigma_delta-0306980220030001@ag143.du.pipex.com>
Source record: 99789

has anyone got a copy of cubase for the atari? preferably cracked, i'm in
a bit of a sticky pradicament.

the thing is that i've got a gig coming up soon and the studio pc has died
quite a horrible death after being upgraded with a darla graphics card,
now it crashes every five minuites in cubase vst (not just every hour ;-),
i told him to get a c-lab falcon but did he listen .....no....he didn't.
so now i'm going to be in a very bad situation with the promoters, and my
musical asspirations are going to waste.:-(

today i glanced upon the old atari and remembered all the fun i had with
it in days gone by :-) so i got it out and loaded up revenge of the mutant
camels and blasted away. i half expected it to crash or bring up an alert
saying "this computer is past it's sell by date", but it didn't do either,
the thought crossed my mind "why aren't pcs like this".
on reflection the atari is perfectly capable of doing the job in hand,
provided i can get the software.
i phoned up a few shops and nobody had it, apart from one place that was
going to charge £299, what we paid for vst!, no thank you! i only need it
till the pc gets fixed!

so like i said before does anybody have the cracked version of cubase?

many thanks to anybody who can help

i'm sorry for asking for dodgy software but i'm kind of desparate.

Hi:

I had the reverse problem (ie a 50Mhz program rolling on a 60Mhz monitor) and
all I had to to was turn VHOLD all the way clockwise until I felt and heard a
"click" then it worked fine for both 50 and 60Mhz prgs. I hope ot works for
you.

I have the MOTHERBOARD for a 1040ST, it has 4 megs of Ram AND
a ICD ADSPEED on it. Three of the wires going to the floppy
drive power need to be reconnected. No floppy drive or keyboard,
the airline trashed those.

I'm asking $35.00 for it. No case, or drive or keyboard, just the
motherboard.

Remove the <*> for e-mail address.

> Then again, maybe the phone company's customer service reps confuse
> ADSL and ISDN...

That could well be the reason, as they were probably not prepared for
someone wanting being online 24h a day with an ISDN line. It would cost
a fortune everywhere except the US. That's different with ADSL, which is
designed for providing a permanent connection, or cable modems which are
much more popular in the US right now than ADSL. ADSL really is just at
the beginning.

The normal ISDN terminal adapter uses a fast serial line to connect to the
host, so any serial port should do. I'm sure there are such messy ones that
use a parallel port, but they won't work with Ataris. I've never heard of
any requiring Ethernet though, but there might be some for connecting
enterprise LANs to Internet.

> >An external ISDN terminal adapter (no it's *not* a modem) can be
> >fitted to any Atari machine. I definitely know STinG workswith it.
>
> Brand, model, drivers, please?

Elsa does several models, just like several other classical modem manu-
facturers. I do not own any, so don't ask me for details. You won't need
a special driver for those as they can be controled with AT commands just
like modems. Therefore, no boot problems exist usually, different from
what Charles said. He might have meant ISDN cards for PCs.

Is that a home solution ? ;-)

Cisco sounds in my ears like LAN-WAN coupling for enterprises.

> does indeed properly use the reference line? Is there something wrong with
> this message?

No it's not, at least not in this respect. However, with such tremendeous
regularity, messages braking threads turn out to be sent by Net2Net, that
I can only conclude that there are several (at least two) versions, of which
the majority seems to be broken. Checking through a few threads, I notice
a posting with the line

X-Mailer: Net2Net (3.699) [MIME]

but without any References: line. So it cannot be due to the editor cutting
it away, it's not inserted in the first place.

You use

X-Mailer: Net2Net (3.7) [MIME]

which may be the whole difference. The author of Net2Net should be able to
clear this up.

Yeah, that's the new version of Net2Net. He took out the word wrap code,
thinking LED does its own word wrapping (in fact, it only wraps what you see
on screen). That's why I'm not using the latest version.

From: jperez@Hawaii.Edu
Message-ID: <6l4p2k$mim@news.Hawaii.Edu>
Source record: 99648

Greetings,

I'm interested in purchasing a desktop replacement that retains
the single key operations in TOs 2.06-4.04. I have Neodesk 4, and I don't
care for Control-this and Alternate-that. If any of the other desktop
replacements allow definable keys for desktop control and do not require
control-shift-or-alternate modifiers, please do mention it to me.

I do not know very much about N.AES, MagiC/Ease, or any other
options currently.

Thanks!

Aloha,
John Perez - jperez@hawaii.edu

because i live a long way away from the nearest place that hires out stuff like that. the nearest is probably glasgow, i live in orkney and i'm not made of money, we can hardly afford to get the pc fixed let alone hire out a setup from half way across the world (it might as well be for what it would cost)
if i could aford to do so i would have bought it for £299 from system solutions and had it sent by over night courier and still not have got it in time, the last time i tried to get stuf next day it took nearly a week and cost £50

perhaps this was the wrong place to ask but i realy will be fucked if i don't manage to do this gig.

I can't explain why, but it's obviously wrong nowadays. The last time it was true was
around the time of Magic 4. The updated WDialog preceeded the release of Magic 5 in
English...

This was reported to me by someone else too. I don't know whether it's a problem I've had
here or whether it's a new version of Net2Net (v3.701 seems to have been introduced here)
and it may have created this problem.

Mail me if this message has the same problem still and I'll copy it over to the author (the
Sysop of my BBS).

I ment the message I wrote in reply to Carsten. Is SCSI 3 downwardly compatible with a TT's internal connection? A supplier I rang today didn't want to guarantee it, but I don't think he really knew the answer.

Wrt the prices I quoted from Tech Direct for Quantum Fireball drives I'm told they are wrong (by a factor of 50%!). Next best is Eclipse who do a 4.3Gb SCSI drive for 117+tax.

If it were down to me (which it isn't) I'd have no qualms whatsoever about making translations available immediately they were available. Include a disclaimer about errors in translation, by all means and send it to the author, but I don't consider a translation to be a modification of even shareware (cmmercial) software. It doesn't change what it does in any sense IMO.

There's also some stored at the Nottingham Uni FTP site:

ftp://ftp.ccc.nottingham.ac.uk/pub/sat-images/

If you're in the UK/Europe/North African region, you'll want the C2D.JPG,
D2.JPG and E2.JPG images. These show the IR, visible light and water vapour
of this region. I can't say how often these are updated as I only collect
the once a day, although they only seem to be updated every 6 to 12 hours.

I've since solved the audio problems, and it seems as though it was HDDriver
that was causing the problem there. As soon as the generic SCSI driver was
disabled, and SCSIDRV.PRG used instead, the CD_Player works. I can't do any
digital sampling with it, as the drive is probably too old (c. 1994), but
at least I've got it playing the CDs.

I've still to see if Magics 'stack overflow' error is also removed and, as
yet, I've not yet had this problem.

> You might try Extendos Pro as that seems to offer better compatiblity,
> although you'll lose LFN and background DMA support.

Hmm. I don't use background DMA as it seems to slow my system down, so
there's no problem with that. However, I don't want to loose the LFNs.
If all goes well, I may yet get my cake and eat it. I just hope it's a
nice rich chocolate one :-))

> non-Windows machine is OK in my book. ;-)

Actually ALL the Ataris have custom chips as well as the Amiga. For instance The YM sound chip in the STFM (I know, I konw it wasnt DMA), which was latter replaced by a DMA chip in the STE, to reduce CPU loading. Only the STFM didnt have a blitter, the STE,Mega ST/E,TT and Falcon all have DMA sound subsystems that can cope with much faster playback than an Amiga. There was the GLUE, MMU, WD1772, etc etc. As far as custom chips goes the Falcon030 has more again, VIDEL, COMBEL, 56001DSP, and more besides. Custom chips alone do not make a better computer. The STFM could create vector graphics notibly faster than the 1000\2000\500 etc simply because of its faster CPU. All these machines had good and bad points, for me the Atari fas always more efficient than any other computer (except maybee Acorn, but who ever even saw one). I have used them for 13yrs, and have reviewed a lot of machines when I went to upgrade, I always come back to Atari. Mostly because of the OS, and truely POWER WITHOUT THE PRICE.

Hi.

>i think CAB should be bundled with the Milan and marketed as a low-cost
>but powerful internet solution ...

Not a bad idea. The only thing is that the German distributor is ASH, who
sells CAB with his I-Connect-package, that needs MagiC to run well.
MagiC doesn't run on the Milan so far.

There will be internet-applications in the Milan-software-package - we will
include the Draconis-package.

I would not mind to try, but I do not know anything about mp3 on the
technical level. Also I almost only program in C. I have done a little
bit assembler, but that has been in the far past. And the floating
point processor I have never used. (Maybe some programs, but I
understand most programs do not use it.) But if you think it would be
possible for me to contribute to the Atari community. I would be glad
to keep the Atari a little more interesting to the userbase.

Well, maybe a bit negative, but I don't think we should all sit here
waiting for the "saviour" in the form of the Phenix or the Wizztronics
computer or a future PPC clone.

We should all use and enjoy our computers with the technology we have
now, but I don't think we can't set our hopes up too high for future
machines. Let's just be realistic

Oh, how I wish I never entered this discussion.

BTW, shouldn't this thread move to the advocacy groups ?

The Quick FAQ is a good starting point (well, that's what it was meant
to be anyway).

> 2.) Can support chips for the 1040STf still be had?

Ugh? You mean spare parts ? It all depends on what parts and what you
are willing to do to get them, but a good source is often to get a cheap
or free broken machine.

> 3.) What is the max memory the 1040STf can have, in the memory map?

You need a memory upgrade board, so it depends on the board. Usually 4Mb
is the max.

> 4.) If a 68000 embedded processor was running, the 68306 for
> example, at 20MHz, would existing software not run?

Erm... I'm sorry, I don't get that at all. An ST runs a 68K at 8Mhz.
There are accelerator boards available if that's what you want. Software
compatibility depends on the software.

Cheers,
Nick

I-Connect doesn't need MagiC. It needs preemptive multitasking, which
can very well be provided by MiNT, and maybe the Milan's "MultiOS"
(isn't that MiNT based anyway?).

Fair enough. Absolutely right about custom chips alone do not a good computer make. The basis of a computer is the OS. It's what you use to interact with the computer on a day to day basis. If you've got a crap OS, every piece of software after that is going to be hampered by it in some way. PCs have the worst OS in the world and so PC users have suffered for years. Mac OS is a bit messy now. Luckily, there are SOME good Operating Systems and we've got them on out machines. Atari OS, Amiga OS, Linux... It doesn't matter a bit if the hardware is not the most up to date, or 10 years old or whatever. If the OS is good, the computer is good.

Cheers

Robert

IMHO I would for starters also be very glad to have a (slow) mp3
encoder/decoder for atari (falcon) so at least it is possible to
exchange files with various resources :)
decode them offline and play them as wav of aif or avr or whatever.

Couldn't that be a starting point? (instead of directly going all the
DSP way)

The Fraunhofer decoder routines I compiled on Falcon have not ever
worked yet...
lots of sync problems.

Soundchip MFP, CPU and ACIA's are easily available. GLUE, MMU,
DMA and Shifter harder to get. MMU goes easily down, esp. when
working on memory expansions. The shifter is in my
experience a very solid chip.

> 3.) What is the max memory the 1040STf can have, in the memory map?

Whithout traick 4Mb, there are modifications allowing 14 Mb.

> 4.) If a 68000 embedded processor was running, the 68306 for
> example, at 20MHz, would existing software not run?

If ST harware is available most of the software will. Games and
demo's are the first to quit.

: Good Luck!

I'm not sure how the "good luck" was meant, but I just wanted to say I have had very good success with Draconis/Adamas, considering its relative youth.

Ironically, one of its best points is that it requires less RAM than CAB, and this won't be an issue on the Milan.

On my 4 meg Falcon I can never display jpgs over 30 some-odd K in size with CAB. It downloads them but doesn't display them. Adamas will display things three times that size (obviously these are just rough numbers as the unpacked pictures are going to vary quite a bit). And Adamas handles the palette a bit better. I just wish it unpacked the pictures a bit faster, like as fast as CAB anyway. I guess this won't be such an issue on the Milan ;-) But I do especially appreciate the way Adamas caches images so going back to a page is almost instantaneous, unlike CAB wich often has to redither everything.

And why don't you begin with a _real time_ MP2 player for falcon (or TT), and then a MP3->MP2 translator, not real time (because of lack of speed). The only MP2 players I saw for falcon are only C ports of PC sources : takes 10 minutes to

decode 1 minute of music !
That would interest me.

Eric

Whilst I don't agree with ripping off software, Atari users get absolutely no support whatever from Steinberg. I've tried emails, phone calls and faxes to the UK dealer for the latest update of Cubase Score (which I think is now 2.07r?) without success. I was repeatedly told that it was on Steinberg's ftp site and it isn't (or at least wasn't when I last looked). Steinberg deserve no loyallty whatsoever from Atari users.

Okay folks, issues 20-37 of ICTARI are not on the regular ICTARI page, and they're not yet on the FTP sites, but can now be found at:

http://www.geocities.com/SiliconValley/Hills/3271/

There is also a link to this from the main ICTARI site:

http://www.elis.demon.co.uk/ictari/ictari.htm

For those that *still* don't know, ICTARI is/was the disk-zine devoted to programing Atari machines. If I ever get enough interest or contributions, then I shall try to do another one. In the meantime, there are now 52 disks worth of programming information out on the 'net. -Just put it to good use. One day there might be a complete HTML table of contents and index.

If you are going to distribute ICTARI via your PD library or user group, please give the snail contact address. If you want to link this site, please get the URL right. If you do there's a chance ICTARI could be a going concern again.

Enjoy Theeself,
"Augeas"

Source record: 99495
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi all. I was just wondering if there was any reasonably painless way to get the Atari to recognize a third floppy. I have a 1040 STf, w/ hard disk and 2 external floppies. It will only recognize one of them. Any way around this?

Also, does anyone know of any Public Domain demos? Not game or program demos, but demos from indiviuals/groups. I have some for my C64, but I have not found any for the ST. They usually consist of a song, with some flashy gfx, and a message from whoever made them. Anyone know what I'm talking about? Any one have any leads?

If you can help with either of these, please post here or email me at: swallow@intergate.bc.ca

Thanks!

Puppy Dawg

I don't know about the Iomega but my St has worked quite happily with
my EZ135 and Linc2 for two years. I used the ICD utilities. My only
problem was the TOS 1.0 only allows the smaller partitions so my
desktop is cluttered with a plethora of drives. Other TOS versions
don't have this problem.

ciao larry

241. NEW : update PARX.SYS

Newsgroup: comp.sys.atari.st
Date: 1998-06-05 00:00:00 UTC
From: Frederic BAYLE <f_bayle@club-internet.fr>
Message-ID: <35771D10.B79CBA45@club-internet.fr>
Source record: 99603

A new release of the PARX.SYS (M&E plug-ins for D2M, D-Form, Piccolo, Diapo, Digital Lab...) is available on my web page.

A quick extract from the 'read-me' :

Alternative to standards memory manager (5.03) and dithering module are available in the folder 'divers' they can replace the originals. They're faster and less memory hungry. The cons are a memory fragmentation risk and an incompatibility with old TOS (<2.0) for the new MEM and an incompatibility with exotic graphic cards for the TRM (2.18).

WARNING: Owner of the 'Update pack Rim/Wim/Ifx' should not use this archive, they already have the latest modules.

Some modules have been updated:
- IMG_XIMG.RIM
- TGA_EDY.RIM
- IMG_WIM.WIM, XIMG.WIM
- TGA_EDY.WIM (replaces TG1.WIM, TGA_16.WIM and TGA_24.WIM)

Some modules have been added:
- JPEGDEMO.RIM (demo version cf JPEG.TXT)

- FRACTAL1.RIM (demo versions from "Fractal Pack" cf FRACTALS.TXT)
- FRACTAL2.RIM
- FRACTAL3.RIM
- ROSACE.RIM

- MATRDEMO.IFX (demo versions from "Pack IFX #1", cf MATRICE.TXT)
- MATDDEMO.IFX

It crashes because of a bug concerning the video ram. Civ assumes wrong
limits for an STe. There is a patch somewhere, written by Alvar Freude
(<alvar_freude@merz-akademie.de>). Civ. runs fine on my MegaSTE with
this patch.

> Is SCSI 3 downwardly
> compatible with a TT's internal connection?

Ideally yes, in reality as someone has mentioned, in the past there have
been problems with some drives such as the Fireball working with some
Atari's. I got sent a Fireball for my ST w/Link2 and it wouldn't work
properly, I have subsequently been told that it required bus arbitration
and this is aparently supported in HDDriver. So to the best of my
knowledge, if you have HDDriver then I wouldn't expect any problems with
any drives (except Wide).

> A supplier I rang today
> didn't want to guarantee it, but I don't think he really knew the answer.

I think you'll be pretty safe in whatever you buy, I certainly have
SCSI-3 devices on my Mac's SCSI plain SCSI chain with no problem, it is
my understanding that devices are required to support all lesser forms
of SCSI. All that said, I'm not an expert and so asking what the
returns policy is, wouldn't do any harm!

> Wrt the prices I quoted from Tech Direct for Quantum Fireball drives I'm

Yeah, its unlikely that a stock TT could decode a full 128kbs mp3, but I'd
still like to hear from someone who's actually* tried* how it manages on
low bitrates, ones suitable for streaming audio. (wink wink :) Say, 8kbps
which is the lowest l3enc will go...

In theory, mpg123 should compile no problem on a Linux-68k system. Hacking
it for MiNT/TOS can't be that hard... :) I wish I could try it myself...

Yeah, forget realtime for now. I see no reason why a plain ST couldn't
decode an MP3 given the proper software and enough time... ;)

Ack, gotta get my MegaST4 back from my dad... Otherwise I have to make do
with a 1mb 520STfm, I doubt SozobonX is gonna like the mpg123 source... :)

>Couldn't that be a starting point? (instead of directly going all the
>DSP way)

I would think one of the existing Unix players (mpg123!) would be trivial
to get running under Linux-68k, (I say again :) as a starting point. Then
you could move on to a MiNT port, and then plain TOS... Now where did I put
that GCC...

246. Partition splitter?

Newsgroup: comp.sys.atari.st
Date: 1998-06-05 00:00:00 UTC
From: q-funk@megacom.net
Message-ID: <EtJd1.24$tg6.557718@wagner.videotron.net>
Source record: 99608

Is there any utility that allows splitting a partition in half?

The idea is, you only loose data that is on the partition you split;
you don't need to repartition the whole hard-disk and reinstall every
application on every partition.

I know the DOS market has such a utility, but I would need the same
for my Atari. Either a GEM/TOS program or a MiNT port of some Unix
utility is perfectly fine for me.

Please Cc your reply to my e-mail, if you have a positive answer.
Thanks.

Source record: 99610

I am currently trying to use Sting with CAB etc. and Daconis Web on my TT. I am able to use both approaches to internet connectivity ok at 19200 bps but have been unsuccessful using modem port 2 at 33600 bps. It connects ok but no data is received. I have used HSMODEM 7. Can any one help with the correct configuration of HSMODEM if this is the problem. Are there any complete English docs?

Austin Walshe

249. FYI: Atari, SCSI Zip and Link II

Newsgroup: comp.sys.atari.st
Date: 1998-06-05 00:00:00 UTC
From: Stephen Angelini <trax@cedep.net>
Message-ID: <357788B7.90A6E457@cedep.net>
Source record: 99611

Hello Atarians!

This must be old news to many of you, but since I couldn't find this information through www.dejanews.com, it may come in handy to some of you.

I recently bought a Zip SCSI drive to use on my PC and musical instruments, and of course I wanted to use it on my Atari. I already had a DMA to SCSI in my hard drive casing, and I had a Link II to connect my Zip with.

1. If your link has an LED on it, it IS a Link II, even though it doesn't have "Link II" spelled out on it. Early Links were shipped with old labels. I have not personally checked if the original Link will work with the Zip, but there are TONS of messages that say that it will not because it doesn't support "parity" (some kind of error-checking).

2. You have to power the Link, because the Zip won't do it for you. There's a file on the Link II disks that shows you where the +5 volts should be connected. All odd pins are grounded, so connect the ground to any of these pins, EXCEPT the one directly opposite the +5 volt pin (on the Link, the "odd" pin opposite the +5 pin is NOT grounded; I chose another odd pin, to be on the safe side).

I built a little box with 2 female centronics connectors to an IDC connector and used an old mouse cable to get power from the mouse port which I connected to appropriate IDC pins (check an Atari owner's manual for power pinouts on the mouse connector). I housed the whole thing in a metal box.

MAKE SURE YOU MAKE THESE CONNECTIONS CORRECTLY OR YOU CAN PERMANENTLY DAMAGE YOUR LINK!!!

If you do all this correcly, you'll be rewarded with the dull red glow of the Link's power indicator when you turn on your Atari.

3. After all this, my Zip STILL wouldn't work. I thought it might be my Link or my Zip, but it turns out you MUST use a SHORT DB-25 to 50-pin Centronics for this to work. I had cheap 6' connectors, and I kept getting "Write Fail" messages. It drove me nuts. Till Tom at IDC wrote back saying that people had experienced similar problems and that I should try using a shorter and better connecting cable. I got myself an 18" double-shielded cable and it solved the problem. It may have something to do with the fact that the Link was never meant to drive long cables; it was

designed to be connected within inches of the hard drive connector.

Hoping this might help some of you. I know I could've used this information! :)

All the best,

Stephen Angelini / trax@cedep.com

250. Falcon 030 and Scanners

Newsgroup: comp.sys.atari.st
Date: 1998-06-05 00:00:00 UTC
From: prunus@post3.tele.dk
Message-ID: <6l8cqu$18iu$1@news-inn.inet.tele.dk>
Source record: 99612

Has anyone got a resolution to this little problem?
I got my hands on two different scanners, a Mustek MFS-6000CX and a Microtek ScanMaker II MRS-600ZS, but none of them is working on my Falcon.
I tested with Homa Systems Mustek Driver, with GTLOOK2 and TradeIT drivers.
I have tryed almost anything I know of, but with no success.

Is there any special trick to look for or special software that I don`t know of?

Aynone got a solution?

cheers Joergen

251. Mega STE mb

Newsgroup: comp.sys.atari.st
Date: 1998-06-05 00:00:00 UTC
From: Kent Johansson <midwinter.removethistoreply@hotmail.com>
Message-ID: <01bd9065$f6a5ce80$0500a8c0@kent>
Source record: 99613
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Somewhile ago I read somewhere on the web that Toad had some MegaSTe motherboards in stock aviable at a rather fair price. As Toad have stoped selling Atari related items I wonder where one may get hold of such a card nowadays, and how much they would cost.

Any hints? I'd rather build myself a MSTE in a tower than a Pc...

Regards..

//Kent Johansson

252. FS etc:Atari ST Gear (5/6/98) Update

I have a selection of Atari ST titles for sale, check my web site for
up-to-date list's and more. www.steverosie.demon.co.uk

This List Updated 4/6/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^
Prices DO NOT include postage.

**********>>>>> Disk Bundle <<<<<**********

Lemmings 2 (1d,ds,1 meg), Archipelagos (1d,ss,),
Black Lamp/Outrun (1d,ds), Test Drive (1d,ds),
Fantasy World Dizzy (1d,ss) & International Soccer (1d,ss)

All the disks are on original media, but have no instructions or boxes.

All 6 disks above for only 5 UK pounds INCLUDING postage.

****

GAME COMPILATIONS

Hollywood Collection (5d,ni) 5
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop

> that GCC...

I have compiled the amp player without problem in Linux/m68k, it was
what I used when I first tried to convert it into DSP code. There
should be no problem at all to make a MiNT version as well. The
mpegaudio package, with encoder and decoder, is already ported to
MiNT. AFAIK, that package also includes Layer 3.

The amp player when decoding an mp3 on my 16MHz 030 + FPU in Linux,
was about 40 times as slow as realtime.

The reason why I requested for a realtime player, is that it's slow to
convert (mp3 decoding plus mp2 encoding) and it takes up much
space. There are already ways to convert it now, for people who would
have spent a little time to compile some of the programs that are
available.

Personally, I use Linux far more than MiNT and TOS on my Falcon, and I
don't have gcc more than for Linux.

If you don't know where to find sources for Unix players, look at
http://www.mpeg3.com

About the Amiga players, I've mailed the author of one of them, and am
waiting for answer.

You're right that I-Connect should run on other operating systems than
MagiC, but there are lots of users out there, who had real problems
with N.AES.
Even ASH can't guarantee, that I-Connect runs on N.AES, Fiffi definetely
doesn't run on N.AES - so this isn't the right way to go.

257. *.st files -> disks

Newsgroup: comp.sys.atari.st
Date: 1998-06-05 00:00:00 UTC
From: Henrik Johannisson <vinco@ebox.tninet.se>
Message-ID: <01bd8fbf$8b73f5c0$10e664c3@mclaren>
Source record: 99619

Hi !

Does anyone know how to get these *.st files to a floppy
that I can use for my Atari.

Since I have a prefect example of an Atari1040 here and a
very bad PC (that cant run Pacifist very good) I would
like to run these *.st files on the Atari. (It was so long time ago I saw
Cuddly Demos for example).

Anyone know anything ?

/Henrik

258. FS: 520 ST System

Newsgroup: comp.sys.atari.st
Date: 1998-06-05 00:00:00 UTC
From: tuf@cyberspy.com
Message-ID: <357efc46.87899092@news.supernews.com>
Source record: 99620

For sale...a very weird 520ST system:

520ST (original version)
2 megs RAM on a 4 meg Newell upgrade board
TAB card installed (disabled..no 2.06 ROMS)
Slim Desktop PC case
ICD ST/HA + Clock
Omti SCSI/RLL converter
Seagate ST157N 150 Meg Hard Drive
SC124 Mono Monitor (if you need it)
2 720k internal drives

The system works fine..all the equipment is in new condition (honestly). The 520 is stuffed full of upgrades. The case will support many more devices (2 full 5.25 inch bays and 1 3.5 available). The case is also wired up to support floppy drives. All connectors are on edge cards so all wires can be disconnected from the case. You add a 1.44 floppy or use one of the larger 720 (half height) drives.

Its a complete setup..the HD is loaded with software. Ill throw in every other random piece of ST hardware I have (drive mechanisms, cables, tweety boards, etc) with the deal.

Im interested in any offer so let me hear what youre thinking.

Thanks, Joe

I don't know what the problem some of you have with support from Steinberg, but I have always gotten what I needed. However, many times I haven't felt like I was treated very nicely. Sort of treated like a poor unwanted relative who drops in during a fancy dress-up dinner party.

But, they have ALWAYS found me what I wanted. Last year I bought a used LEGIT version of Cubase from a guy on the Toad board, I found the key was damaged, he was unaware that it was, and I believe him, called steinberg, they replaced it, but of course, they charged me for it. I also purchased the latest version (as an upgrade) of Cubase score.

I will be the 1st to admit it doesn't run a quickly as my pentium, but the difference in the money involved, for me is an issue! I am NOT in that big a hurry.

seeya!

I've never seen a WYSIWYG editor for ST guide. There is a compiler
included in the package, and it's fairly easy to make standard text
files into a .HYP file by adding the simple node commands. Were you
thinking of writing such a program?

With STinG, you need HS-Modem and Serial.CPX (included with STinG)
to correctly set your Modem2 port for 38400 bauds throughput.

With MiNT, only HS-Modem is needed, because MiNTnet sets the modem speed.

That's an interesting idea, using a 68306. I have the databooks
on it (and an OS-9 based machine using it), at 16MHz. It's a bog-
standard 68000 core with 68681 DUART (two serial channels) built in,
plus a DRAM controller. Hmm, it would probably be very compatible
if installed as an upgrade (plus it would give extra DRAM capability,
extra serial ports, and more speed!). Oh yes, it also runs off of
a PLL so you can change its speed on the fly, in software, so 8 MHz
compatibility would be a snap.

Hi all,

I recently left a job (well, the job left me 8-/) where we were
designing a VME-based system (Motorola 68360 CPU). For video, we used
a set of cards from a company called GreenSpring Computers
(I think the URL is http://www.greenspring.com/). They have a product
called the VIPC310 -- a 3U formfactor (Eurocard) VME adapter for their
I/O cards, called IP Modules. One of the many IP cards they offer is
the IP-LCD, an SVGA CRT/LCD controller based on the Chips & Technologies
65545 chip.
Anyways, I got one of each of these cheap (due to my former
company's situation), and have installed it in my Atari TT. The machine
didn't blow up (good first sign), and I'm going to make some small
efforts at getting the VGA initialized. I don't know how fast
the video will be (IP cards use an 8MHz bus), but the chip can do
up to 1024x768x256 colors, so would be good for X-Windows/Linux. Someone
would have to write a framebuffer device driver for it (probably
better to adapt source from Linux/386?)

If other TT users are looking for a graphics card, this *might* be
an option (although I don't know how good their prices are). There
are many other manufacturers of IP Cards and carrier boards, so if
GreenSpring is charging too much, there may be other options out there.

Just thought I'd mention it, since I see messages once in awhile here
asking about TT/MSTe graphics cards.

Sort of but not. ;-)

My version will invariably produce corrupted graphics when running
through the "win" sequence but is only a visual annoyance.

In my case the major problem arose when changing government types - ie
anarchy. If too many cities went into civil unrest before the new
government took effect, then the game would crash. This was resolved
by increasing the happyness factor temporarily, or simply by using the
cheat editor to change immediately.

Right you're. I've tried it with N.AES but never succeeded to make it run.
However a few months ago I had it running under Geneva/Neodesk/MiNT.
Nowadays for some strange reasons I doesn't run anymore.

>Even ASH can't guarantee, that I-Connect runs on N.AES, Fiffi definetely

Re: "StinG/CAB/CAB.OVL", Peter Rottengatter scribbled the following on 04 Jun 98 @ 17:04:36:

PR> No it's not, at least not in this respect. However, with such
PR> tremendeous regularity, messages braking threads turn out to be
PR> sent by Net2Net, that I can only conclude that there are several
PR> (at least two) versions, of which the majority seems to be
PR> broken.

No, there is a known bug, where the index file that holds the reference lines becomes corrupted after a few thousand messages are received. If you keep using that index file, all of your replies will start new threads. That's probably what's happening on the messages where you're seeing N2N break threading.

I get around the bug by having my index file automatically deleted each day when my daily maintenance is run (I download a LOT of messages in a day, though many are just headers). The only drawback to this is when you're replying to an old message (i.e. received before your index file was deleted), that too will break threading. However, that's rarely a problem, as I make it a point to only download messages when I have time to read them all.

I hope they also find a US dealer. I myself contacted the makers of the Milan and offered our companies services and sales expertise and to become an authorized Milan dealer in the USA. I have been a long time user of Atari and the company I work for, GodFather Computer, although currently only selling Mac and PC product, would entertain selling and special ordering Milan's for USA customers. The only problem is I have not heard back from them regarding this issue...

If you decide to send them an email, remind them about our company and mabe we can get some action.

GodFather Computer not only sells computer equipment but do high volume component level repairs on most all computer equipment including monitors, disk drives, terminals, computers (MAc and PC), power supplies, etc... So we would make a great location in the USA to be a complete provider for the Milan.

Let them know about us...

Take Care,

Internet Relay Chat on Monday, June 8, at 21:00 Middle European Time:

You are cordially invited to meet the Milan Team in the Internet!

Only one week, and the Milan will be available across Germany.
We all are very excited about this fact and would like to provide you with
detailed information on this up-to-date computer system.
Take your chance to ask your questions!

It is very simple to access the IRC:
Almost every internet provider should be able to offer IRC services so that
you only need to install the IRC client software (e.g. AtarIRC for STinG) on
your computer. These are the default settings:
IRC Server (/server): irc.funet.fi (others are possible, too)
Channel (/join): #atari

We are looking forward to meeting you on the 8th of June, at 21:00 Middle
European Time (= GMT +1 hour)!
(GMT- 5 hrs: Eastern USA/Canada; GMT - 6hrs: Central USA/Canada; GMT - 8hrs: Pacific
USA/Canada)
To download the a.m. software, just follow the links on our Website:
http://www.milan-computer.de/links.html

>help with the correct configuration of HSMODEM if this is the problem.
>Are there any complete English docs?

I think the problem is that Modem 2 does not have standard speeds so
the modem will not recognise the faster ones. I have been trying to
find the docs. but they have gone missing for the moment!

If you have the prog. TOSPORTS (I think) or any of these diagnostic
programs (Profile, Sysinfo etc.) you can find out what speeds are
supported and compare them with the spec. of your modem. I think you
will find no matches above 38k8.

I have connected via the Serial 2. This has standard speeds and I find
that running a DTE of 115k2 with a DCE of 28k8 is both fast and
stable. If you do this you will, of course, need to use SCC.PRG in the
HSMODEM set-up.

I have sorta the same problem. I think it has something to do with the Hard Disk Cartridge itself. Some of mine are recognized as an EZ 135 cart, and others as an SH Megafile disk. I have reformatted them on every Atari possible, on a PC and Mac as well. On the alien machines, they are recognized properly, but once repartitioned with HD Driver (or anyother driver for that matter) they asume the identy of an SH drive. I have used ICD Pro, SCSI Tool and AHDI too. At one time, I thought that because I had formatted and partitioned some with the IDE EZ in my Falcon, caused a bug when used in a SCSI EZ drive. All I can say is your not alone. With EZ problems.

Mike

Hi

The MiniS hd has embedded SCSI controller and parity is
enabled/disabled by software; the ICD software tells me it's disabled.
On the CDR it's disabled as well.

Thanks
Cheers! for now

Yep there is a way of getting more than one external floppy on the ST, for this you will need to buy some hardware. The only hardware I've come across that will do this is called the Discovery Cartridge by Happy Computers, if you get one with the correct option you can have a maximum of 3 external floppies. Of course you need to run drivers to use them, and you will need an external drive with a pass-through socket on it to use 3 external drives. My question is, if you have a hard drive why the hell do you want more external drives or any external drive come to think of it???? I very rarely use my external drive, and I do have reason why I need 3!!!

Regarding the lovely subject of demo's; it's allright you can come back out now:))) Yep! there are absolutely loads of demo's of all shapes and sizes, good language and bad; and some are absolutely goooooood.

I've not come across too many on the internet, maybe it's because they mostly take up a whole disk and are in sector format as apposed to file format.

Mostly they consist of flashy graphic and some musik, but also they can have a mini game or sprite that you move around with a joystick etc.. and enter doors or zones for differrent demo's; some even done by other code groups all on the same disk:))))

Anywayz I hope this 'elps:)
Cheers! for now
Steve

On mine I don't think its the carts themselves. The whole drive seems to be non-existant. The carts were partitioned with Diamond Edge, all in the same manner as 1 big partition each.

> thought that because I had formatted and partitioned some with the IDE

I didn't know there was an IDE version. Is it slower or faster than the SCSI?

But when I disconnect the IDE it recognises the EZ135 and also another SCSI HD
which has worked fine throught all of these current troubles.

> of HDDRIVER, i. e. the demo version of HDDRIVER 7.5? 4.6 is very old,
> the current demo version is available from
> http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html

I hadn't tried it yet, as I'd just be happy with things as they were. But I'll
try the demo now. I'm getting a 1.3G IDE in a few days, so I'll have to see
what happens when I install it.

I have a file called Wilber.zip that outlines the html commands in a easy and organized way. Its a bunch of html files themselves. The zipfile has everything organized into folders. I'll send it over, its just 168K.

>exchange files with various resources :)
>decode them offline and play them as wav of aif or avr or whatever.
The docoder should be possible, the Fraunhofer IIS (the developer of the format) says the code is available for variuos processors, also for Motorola DSP56000 family, so the Falcon could do a good job. The encoder could be a problem, because even my P200MMX needs about 5-10 times the length of the input wave to encode it. An Atari is about 50-100 times slower, you know what that means...

>Couldn't that be a starting point? (instead of directly going all the
>DSP way)
That would be the only way at all!

Hi all,

this morning around 05.00 hrs I switched off my system because of a huge thunderstorm in my area.
When I turned it back on at around 09.00 the main monitor (SVGA) wouldn't come on (the light failed), so I hooked up the spare VGA-paperwhite onto the card.
The only thing it showed were some flickering white lines on a black background.
I hooked it to the regular TT monitor socket, re-organized the C-autofolder so I could run under MagiC but without NVDI (which also drives my card), so now I'm stuck with a bloody 16 greys output. Booooooooooooohhh!!!
Haven't found out yet whether the card blew up too or not...

The problem now is Newsie had set several windows to a height/width corresponding to my regular 832x608 res, but since this TT only shows 640x480 some of the windows cannot be resized because the resize/full screen buttons won't show...
So I'm gonna try to run Winx for a while to be able to shove up the windows to the left enough to be able to reach my fullsize buttons and save the prefs again.

Heck, I'm praying my card didn't blow up as well.... my dough's out!

(Wish me luck, please!)

I'm currently looking for another copy of STOS (boxed with manual) and a copy of
the Game Maker's Manual.

I had both at one time but sold 'em when I sold the ST. I now find that I need 'em.

Alternatively, if there's anyone in the UK who'd be willing to lend 'em to me for a
couple of weeks then I'll refund the postage. I've started work on a STOS-like
language for the PC and need to see how STOS banks and modules are structured
so that I can build-in a bit of compatability.

Yes you will need a driver Jeff

ExtenDOS is probably the best (system solutions) or their are plenty of p.d. alternatives including one from Atari themselves!

>Will it be able to read PC discs?

It will read them but won't run the software on them (obviously)

However you still won't be able to read apple Mac disks. I think there's a program that lets you do this 'though (somewhere).

mark.

Hi Charles,

well, it wasn't the storm that did it. When I switched off everything was still
fine...
Normally I pull the power plugs from the sockets and disconnect the phonelines
too. But it sure wasn't lightning that did the damage this time :-(

The monitor is off to the PC dealer now for repairs, but I'm very much afraid
the Matrixcard has blown too....

In the meantime I edited the Newsie prefs file manually, everything greater
than 640 and 480 has been set back to these values, so now I can reach all the
gadgets again :-) Winx wouldn't do the trick under MagiC!

Actually, it has nothing to do with your stack. It's an offline utility that
converts between NOS or Oasis message formats and Fido. I don't know of an
Internet source for it. I get it direct from author Paul Baker's BBS at
90:102/140 (freq NET2NET). I can email it to you if you'd like. But it
won't do you any good unless you have a Fido type setup.

The question remains:

Since Toad areout of the picture, why are ataricentral.com and atari.net
domains still showing their Atari stuff?

If they're not involved, then they really should update their pages like
Computer Direct recently did after bailing out of the Atari scene, IMHO.

Furthermore, they should release both domains, as other still involved
in the Atari scene will undoubtly want to keep on promoting Atari...

Hi!

There are several, in fact. If you want one to play Atari games on,
then PaCifiST (Giftware) is *the* choice:

http://www.pacifist.fatal-design.com/

For serious stuff, there's TOSBOX (Shareware). I've tried this one,
briefly so far, on a P200MMX with 128MB SDRAM, and it's good (though I
haven't benchmarked it yet [g]). It allows a 14MB ST, with up to
1024x768x16 colour resolutions, assuming VESA 1.2+ graphics on the PC:

http://www.geocities.com/SiliconValley/Vista/4448/

Both the above run on DOS, but WinSTon, which is in an early stage of
development, runs under Win95/NT:

http://winston.fatal-design.com/

I'm assuming you know about the two commercial alternatives, but feel
free to email me if you need more on those. I'm hoping to try PaCifiST
and WinSTon on the same PC as above in the next few weeks.

I've just checked these URLs, and they're all valid as of today
(6/6/98 19:31 GMT). I hope this is of some use to you.

All the best,

Matthew Webb

310. Atari ST questions

Newsgroup: comp.sys.atari.st
Date: 1998-06-06 00:00:00 UTC
From: pfloyd@sprintmail.com
Message-ID: <35798D68.9B95549A@sprintmail.com>
Source record: 99528

Hello all,

Just wondering who now owns the rights to TOS and GEM? I know TOS was
Atari and GEM was DRI, but now that both companies are out of existance,
who owns the copyrights?

Ajai

Good news - have you mailed Uwe about it?

I found that later versions of HDDriver had a problem with the generic SCSI
driver clashing with something in my auto folder so I fell back on to V7.03
which is fine - call me a Luddite if you want! :-))

There are a few supported features that are disabled and there are some hidden features that you won't be able to find. Outside of this try checking out the HPP Home page at the following

http://www.hh.schule.de/hhs/mjapp/hpp.htm

if you can't seam to get to this page I can always attach a file to e-mail for you.

dwmoar@spiritone.com

check out the Portland Atari Clubs WebPage at http://portland-atari-club.cc

There is a place call ccdomains.cc on the web. There are quit alot of good domain names that have been used in the .com .edu .gov that are still available using the .cc extender. I went this way as the company I work for wanted a web page and their comapny name had been used both in the US and the UK. It was still available using the .CC extender in bot the US and UK. I also went this way with our local user group webpage.

> Yes the TCP dropped counter increments each time the TX/RX leds light
> but nothing happens. What does this mean?

It means the reply of the server to the connection attempt is (thought by
STinG to be) corrupt. Since it is unlikely that it really is, there must
be something (a bug probably) causing this misunderstanding.

> Why doesn't it happen when
> I post to a news group?

Dunno what NEWSie does differently for news.

> I think we are getting close to resolving this.

If you run multitasking, then go through all the steps again, just until
you're about to press the send button, but do not press it yet. Instead,
start up LogSTinG, then use LogCTRL (both are in the STinG distribution)
to activate it. Make sure you configure it to log TCP_open, set_dgram_ttl
and check_dgram_ttl, but nothing else. Make it log all parameters including
buffers. Then, after finishing configuring it, and leaving LogCTRL, press
the send button in NEWSie and wait until the mail is sent. Restart LogCTRL
and deactivate/remove LogSTinG again, and send me the resulting log file.

Note that the log file will contain the contents of the mail so make sure
not to send anything confidential ;-)

Aha, so indeed Net2Net is broken ;-) only that you found a clever way around
it. So this should be told to everyone here who uses it.

BTW. is it still supported ? A new version should fix the bug then, at least
if it's been reported to the author.

Hi John

I had a short fight with Emailer here, it wouldn't run from the I-connect I had running but had a newer version (1.2?) with it, however it refuses to run complaining about some paths are too long (???????? explain that to me). AFAIK it wraps according to your window size setting, don't know if that are hard or soft breaks or even none, and there's no option to set a given line length.
I'm not sure what it actually sends out, but there seems to be a *BIG* problems on lengths. I get some messages in with Newsie that go beyond the 80 chars and I'm not able to scroll horizontally. So I always delete them upon recognizing looooooooooong lines... Too bad for the author, but I'm not gonna fight to just read a bloody message.

That's my 2 cents again

> >>you need to so it wraps at around 70 cols, as per Usenet standards?

BTW: It is very common to use around 70 cols - but thereï¿½s no such RFC.
There are some parts where one can read that a newsreader should not
necessarily demand 7x cols per line - long lines are allowed.
Unfortunately most of the Atari newsreaders donï¿½t like this, though.

From: Chris Moffa <chrism@snip.net>
Message-ID: <357b0236.0@news.snip.net>
Source record: 99403

Hi,

I have a 1040STf unit as well as a power supply for the 520ST.

The 1040 is bare, but this is the model that includes the floppy drive on the right side. I have no monitor to hook it up to, and unfortunately there is no R/F output so I can't "see" what it's doing during bootup.

It requires a 3-prong female to male power cord, identical to ones found on modern PC's. I plugged mine in from my PC and the power led came on, and the floppy drive spun up and it appeared the computer was trying to access the floppy and was looking for a disk.

I can only assume that it's looking for a TOS disk to boot from, although I could be wrong. It's been a long time since I played around with my 520ST so I have forgotten the behavior. I thought they put TOS on ROM post-1985, when the 1040's came out.

I also have a 520ST power supply which is also untested available.

I'm not looking for much money on either of these, so just make me an offer. I would also accept a trade offer as well. But I don't collect Atari computers at this point. I collect classic video games, newer PC games, dungeons & dragons, and board games. E-mail me a list.

Please send your cash or trade offer to me at:

chrism@snip.net

Here's the link to the pic: http://users.snip.net/~chrism/pics/1040stf.jpg

Thanks!

Chris

Hell just generic S3 support would be a good start, as there's a whole
lot of cards out there based on some kind of S3 chip.

I was wondering if anybody has had any success getting colour output from the Canon BJC240? I have used it fine in black and white but can't get colour output. Are there drivers for NVDI or do any other progs (maybe imagecopy) have drivers for this printer.

Many thanks for any help

Niall Moran

339. Need help with Hisoft Basic 1.23

Newsgroup: comp.sys.atari.st
Date: 1998-06-07 00:00:00 UTC
From: tom <tommy@niagara.com>
Message-ID: <357B0FC2.550B533D@niagara.com>
Source record: 99409

I'm hoping someone can help me with a wee little problem I'm having
in Hisoft Basic 1.23 (I know - it's an old version).

I have made a small function to input text from the screen at a
specified location. It uses inkey$ and then a print routine to echo
the characters back to the screen. It checks for backspace and
backspaces accordingly, also checks for tab and return to move on
to the next field.

Anyway, the input is kept in a variable called result$. Everything goes
according to Hoyle until the function ends and returns to the main
program. Result$ is lost.

I know it all works, because if I print result$ to the screen before
the end of the function, it prints the proper value.

I am assuming that somehow I have to pass the value back to the main
program, but it is elluding me how to do that. It is easy to see in
the manual how to make variables in the main program available to
functions, but not how to make variables in functions available to the
main program.

```
for example
call_sub(parameters)

sub call_sub(parameters)
rem everything works fine in here
print result$ ' prints accurately
end sub

print result$ 'now prints a null string
```

Thanks for any help. There are workarounds to this I can do, but now
I'm curious about how to pass variables back to the main program.
I'm sure it's some stupid little thing, but I've been poking around the
manual for an hour or so and haven't seen it.

Tom

Further to my last post on this subject, I have discovered that naming the variable as shared allows its contents to be available to the main program.

But unfortunately, that's not working in my program, perhaps because I'm calling a function from a function? Who knows. I'll have to check futher.

Jeff,

By 'blister packs' are you referring to the terminating resistors? They look like an oval cylinder with 10 or 12 leads. There should be two of them on the last drive in the SCSI chain. If you take them out, mark them so that you know how to put them back, they have a Pin 1 but the PCB on the drive is not always marked.

ACSI port (19 pin) ---> ICD Adapter ---> HDD ---> HDD with Terminating Resistors.

You are on the right track keeping the SCSI ID's different, so your problem could be the terminating resistors or it could be that the Conner has Parity Enabled. If you have the docs for the drive see if the Parity can be disabled with a jumper. Some drives can only disable parity via software and you will have to find a helpful PC owner with a SCSI card to help you. If you don't have the docs for the drive, try Conner's web page. (Sorry, I don't
know the URL, but you should be able to find it via Yahoo).

I have noticed that during the last 2 or 3 days, while using either Newsie OR CAB 2.0 I seem to be getting a lot of bombs going on!

I had one happen just before this post. I made a reply,(Newsie.88/Everst)

and when I went to same it I got 2 bombs, I got the message from Neodesk about pressing R or P or return, so I hit R to see the numbers,(No I don't understand them), it gave a list of numbers, when I hit return, I got 4 bombs!!!

Could something inside the machine be starting to act up?

349. New IDE drive seems a bit slow

Newsgroup: comp.sys.atari.st
Date: 1998-06-07 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <42002796_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 99419

I've just ditched my original 127Mb IDE drive that came with my Falcon, for a new 1.2Gb Hitatchi IDE drive. I've just swapped them over.

I use HD Driver 7.02, and the new drive seems reliable enough (I did a sector test on it).

What I have noticed is that program launching seems much slower. I use MagiC 5.11, MagxDesk (that came with MagiC), and HD Driver 7.02. Whenever I launch a program by double clicking on it. It seems to think about it for a few seconds, then launch it. Once the drive gets going it seems to work at a reasonable speed. It just seems to be the initial launching.

Is this normal, or is there something I can do to speed it up.
I've increased the FAT buffers in HD Driver from 22k to 359k, which I think should be more than enough?

Gary

Get everything from the CS-TeX directory. -I think CS-TeX is
the easiest to set up, though it's a while since I've done it.
Each archive goes on its own disk, you run the install prog,
and there you are. I've had great results from CS-TeX, it's a
shame TeX.TTP always seems to run full-screen on my Magic set-up.
It does work, though.

There's also Linder TeX, but I've never managed to set it up.
Is it on any CDs ?

If you're going to use TeX, you might as well dabble in UDO as
well, I use it to make pretty TeX versions of my documents, while
folk at work can read grotty .RTF files into Macro$oft Drow.

Good Luck,
"Augeas"

I have noticed that during the last 2 or 3 days, while using either Newsie OR CAB 2.0 I seem to be getting a lot of bombs going on!

I had one happen just before this post. I made a reply,(Newsie.88/Everst)

and when I went to same it I got 2 bombs, I got the message from Neodesk about pressing R or P or return, so I hit R to see the numbers,(No I don't understand them), it gave a list of numbers, when I hit return, I got 4 bombs!!!

Could something inside the machine be starting to act up?

362. I need help bad...I cant figure out how to get a HD tow ork with my ST.

Newsgroup: comp.sys.atari.st
Date: 1998-06-07 00:00:00 UTC
From: Jeff Thomas <Yanni@mindspring.com>
Message-ID: <6lddh2$a5u$1@camel19.mindspring.com>
Source record: 99551

Ok....I have been working on this damn thing for the last ten hours. It is three in the morning and I have given up. I purchased a 500 meg SCSI Connor CP3540 hard drive today and wanted to add it to my existing hard drive setup on my 520ST/1040ST/Mega ST. What is my current setup? I have an ICD host adapter connected to a Seagate ST157N drive. Since the Seagate drive worked, I thought.... let me try to hook the new one up in its place....didn't work, would not recognize, format, find.etc.....

Then I decided to daisy chain them. Did not work. It kept finding the Seagate drive but never could find the Conner drive. I read through the ICD Manual but I am using a newer software than the manual follows. I think the version I am using is 6.5 1994 copyright. Although I know nothing about SCSI, I do know this much:

The ST157n drive was set to "0" and the new drive was set to "1". After reading, I discovered about blister packs. Since the new drive did not have any, I moved the ST157N to drive "1" and the new drive to "0". The ICD only would read: "0" unknown device, "1" ST157N. I know it is finding something on "0" but will not do anything after that.

While I was screwing around with this thing, I messed up my original drive....it wont boot now. I think I can get this on fixed because no matter what config. I have tried, the ICD adapter always finds the Seagate HD.

Any suggestions on how to get this thing going. What am I doing wrong? Will the Conner drive not work with my ICD adapter. I have two ICD adapters and both work great for the Seagate drive?????? Do I need to buy a different software package instead of using ICD's even though the adapter is built by ICD?

Thanks for any help.

Well, actually with embedded HTML in messages, there is a certain risk (on the PC) of having a message run javascript or ActiveX applets that could do just about anything. There is also the infamous word/excel macro virus that can spread through email.

Nothing to be afraid of on our platform though...

Cheers,
Nick

>any requiring Ethernet though, but there might be some for connecting
>enterprise LANs to Internet.

Looking at the info from a certain local ISP (www.visi.com), you can get ISDN terminal adapters that connect with Ethernet or serial. Ethernet ones are probably best if you have an existing ethernet, however since ethernet cards for Atari's are rare, you (probably) can't connect directly. You could try running a null modem cable (or a parcp cable?? :) to a PC and run SLIP over it... You'll probably need a Linux box, I know that'll work... :) One of these days I'll have to see if I can get Win95's dialup server thingy to start a SLIP (PPP?) connect over null modem, and pass packets over to WinGate...

A serial one ought to connect directly, but you'll need a port that goes up to 115200... Not sure how these communicate though, I would guess they can fake a generic hayes modem...

Actually, just noticed an ISA card listed with the serial TAs. I'm guessing this appears as a serial port with a TA connected to it... You'd have to use a PC as a gateway like with Ethernet... (actually I guess you could just make the PC pass stuff between a real serial port and the card, but that would be silly... ;)

What -would- be another useful feature in or alongside POPWatch would be
an analysis of emails from each ISP which occurs in the kill-file,
giving the number accepted and the number rejected. This would enable
you to generalise, e.g. if you found that you never accepted mail from
hotmail.com (just an example, you understand) you could replace all the
individual entries with a general one for that ISP.

Yes. You will need Extendos or Spin.

>Will it be able to read PC discs?

You will be able to read text, sound and graphics files which are in a
format understood by Atari viewers but, of course, you will not be
able to run PC .EXE files which steer many of the hypertext volumes.

Hi Steve,

heck, I don't know... I've got these two Quantum Trailblazers, they both are
a little over 2 years old, together it's 1.7 Gb and sometimes I'm afraid
that one night I'm gonna wake up hearing screaching noises or something and
find out they just simply gave up (these two have been turning continuously
for over two years now...)

Apart from that the TT may produce a loud bang and say "Goodbye"...

What I'm wondering is: I'm still not sure the card has really blown up, I
just hope for the best. What IF it has gone? Any dealers who can fix a card?
Or is it just a matter of "Unplug & Replace"???
AFAIK Matrix still exists, but they make medical gear now.

HI Peter! I think you are right, but if you are a PC owner (as in Windows)
and receive a Microsoft word document whose macro contains a virus, then
you can get one that way, right? (even though thats not really the E-mail
but the doc. thats doing it) Thanks! ;-)

Hi,

I can add: if you're running Soft-PC and are able to use the FSA drive, you
can at least run DOS programs from a CD.
I'm using Metaxbs with the old Metados drivers and run several DOS apps
straight from the CD!

Can't remember if it's already been suggested or not, but are you using
the same cables on the PC as the Atari? Maybe one's bad.

Just so someone can archive a definitive answer, what are the legal
partition sizes for:

TOS	Size
1.00	
1.02	
1.04	
1.62	
2.06	
3.06	
4.04	1 Gb

Thanks.

38400 is the maximum on Modem 2. 57600 is not available on a TT Modem 2.

Good luck on finding a brand new, or even second-hand, ET-4000...

We really should forget about ET-4000 and instead make drivers for
real modern products like the Matrox's Millenium and Mystique cards.

True but even then you'd have to extract and open the infected file in
order to get infected (anyone with any sense using a PC would virus
check it before opening it). As for embedded HTML etc, this is only
likely to affect people who insist on using non-standard mailers
(frequently browsers masquerading as mailers), in which case more fool
them, really. Normal mailers would insist you save out the embedded
HTML file or consciously pass it to a viewer (ie your browser).

>Nothing to be afraid of on our platform though...

Unless someone comes up with a mailer that'll extract and run embedded
TOS binaries. Hopefully we have more sense!

Try LPS (Long Play Sample). I think I found it at ftp.funet.fi, but it may be at other archives too. Latest version is 1.24 AFAIK. Certainly works under MagiC on my STE (I use it as default player for CAB). Some points to note though:

1 It doesn't use DMA sound so I guess it might not work on a Falcon unless the bird has a normal ST sound chip.

2 As a result it doesn't play back in stereo, though it plays stereo samples in mono.

3 It plays samples directly off disc so it can handle long files. Under MagiC I found this made the sound wibbly until I realised I had background DMA access turned on (supposedly bad news on an ST anyway). Once this was turned off LPS sounded as good as it does under TOS and MiNT.

4 It fails gracefully when it comes across a sample it can't handle (very rare occurrence IME: it supports most things), unlike some other programs which crash or play nasty tearing-paper noises through your speakers for prolonged periods (eg GEMjing).

Nope, I had to break the above manually at "wordwrap".

>I`ll try to resize the editor window to see if that helps.

I can't help you with the specifics (I don't use Emailer) but after some cajoling (!) some of the early users of it here managed to find a way to get it to wrap properly, so don't give up!

Maybe one of them can tell you how to do it? Calling all users of ASH Emailer!

402. Viewers, revisited...

Newsgroup: comp.sys.atari.st
Date: 1998-06-07 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <897238213.12917.0.rover.c3adfca1@news.demon.nl>
Source record: 99591

Because of my SVGA monitor is now down, I'm forced to use the old VGA paperwhite again in TT-med mode.

Using my regular viewer it meant endless waiting for the bloody dithering, so I tried MGIF again... Wow, it's still a fast one! It *loads* in maybe the same time, but the dithering goes pretty fast, plus the output on my screen is a lot better than other viewers can provide.

I've always had trouble with the menu-item "Config/save" however, soon as I try that it gives me the fsel, then I select MGIF.OPT, hit return, it comes back with the fsel and on the next OK it hangs (both under MagiC and TOS). So I fetched the latest version from Johan's site, but it's still the same thing. However, I managed to "set" the options manually in the OPT file.

One option I especially like in MGIF is setting H/V ratio. Appearently, the TT makes pixels larger vertically than horizontally in TT-med. Somehow this happened using a PTC1426 as well as on the VGA paperwhite. Also when the PTC was hooked up to the card, the H/V ratio never looked good. Butterflies looking "thin", ya' know... (who thinks I'm looking at piccies of Joanne Guest here????)
Strange thing is, when I connected my SVGA to the card, I had no problems on the ratio at all... (Anyone who can explain this, is cordially invited...)
Anyway, MGIF has the option to set the ratio if you want that non-standard.

Nice piece of software, Johan!!!

Milan, the new TOS clone, uses an S3 Trio V64+ graphics card. For any card, though, I think the most trouble would be writing a good driver for it. The actual hardware might be the least of the problems.

Dave,

I'm no expert on this but I have experienced times when this happened.
Have you tried another disk in the 135? If so and it gets recognized, it
is a problem with the first disk.

Do you have ICD Hard Disk Formatter? If so, the screen where you enter
size of partitions, etc has a selector in the lower left corner called,
WRITE PARTITION INFO ONLY. It rewrites the partition info exactly as it
was before and will allow you to recover from a damaged partition sector.

I have used this twice and it worked both times! BTW, it has lots of
warnings about last resort, etc but it basically is your last resort!

Good luck!

Charlie

Never mind that Matrox is one of the more secretive companies out there...
Not to mention all 'real modern' cards are going to be PCI or AGP, which
I'd guess is much harder to interface with VME...

How hard is it to make a general ISA interface, that'll let you connect any
card. Just write generic VGA drivers, and let everyone else hack at
specific chipsets...

And then, hooking up a GUS soundcard would be a neat hack... I suspect the
DMA used by soundblaster cards would be a pain to implement though...

It's most likely the cab.ovl crashing CAB. Do yourself a favour and buy CAB 2.5, or wait a while for 2.7 to be released in English. I've found CAB 2.5 and cab.ovl 1.2904 to be quite robust -- a world of difference from running older incarnations thereof.

> h> with this patch.
>
>Does anyone have this patch on a website?

I don't know if this is correct, but I have this file listed as a fix:

"Did you know that there is a fix for Civilization?? The program will
bomb
when you go to conquer the world, but if you change the file slam2.lbm
to
slam2.bbm it will fix that error.. Programmer admits he screwed up.
Still leave slam2.lbm in the same folder, just have two duplicate
files
with different extensions...."

I have no idea if this statement is true or not. I would really hope
the company can compile another with this fix as well as making work
on STe's, instead of having patches.

>Here's the proof that the "WIN A HOLIDAY" Virus is a hoax. It comes

But it IS a virus... just a different one! Nooo, way! Just think about it! A virus is a small program that you receive without your consent, usually disguise as something else, that tells your computer to in some way duplicate itself, and disturb in some other way your work/job/data...

The only difference with this "virus" is that the program stream isn't directed to your CPU, but to your brain... It actually tells YOU to copy the message and send it along. In doing so, it doesn't actually do any real damage (but again, many virus don't either!), except for that other person that received it to discard it in some way

What I don't understand is... People are actually falling for this! It's like I was to tell you to get rid of lawyer-mail by discarding it without reading it and passing the message along to all your next door neibours...

Portions of the GEM code are from DRI. GEM was included in TOS. Therefore
TOS (including Atari GEM) belonged to DRI and Atari. Atari always refused to
release TOS in the public domain because of this dual ownership.

> In advance - thanks

There's also MagicPC, but MagiC is more a new OS than a real emulator.
It will run most clean apps in it's improved multitasking OS.

There are also freeware/shareware solutions such as PaCifiST on the PC
and NoSTalgia on the Mac, but these are more games oriented. They will
run even "dirty" software such as games and demos.

The choice of an emulator relies more on what apps you want to run on
it.

Links are all in the Quick FAQ

Minixfs can use V2 filesystems, don't know what the upper limit is, but 500
Mbytes works.

Read the docs in the Minixfs sources, all the information is there.

What's your hard disk driver? As far as I know for large partitions and
the MinixFS either CBHD, HuSHI or HDDRIVER are required.

Kev, you could try Play Sam: it works fine with Falcon/magic/thing
PLAY_SAM.PRG is a little clickie to let you hear all those wonderful
samples that most Falcon applications won't let you play. At present it
will recognise AVR, WAV and VOC format samples in 8/16 bit mono/stereo
signed/unsigned format and standard Amiga IFF samples (8SVX format).
You can hear sample files by clicking on files with.WAV or .AVR extensions
and, keeping the mouse button pressed, move the mouse pointer over
PLAY_SAM.TTP so that it is highlighted. Now release the mouse button.

Minixfs v2 has no limit in the partition size, but it is still limited to
64k inodes.

Hi,

is there anyone in here who knows where to reach Aixit Germany by E-mail?
I went to their page, filled in a report and tried to "send" it to them by
means of the online-service, but it keeps telling me "unsuccessful".

Since there is no E-mail address mentioned, I'm asking here.

I'd like to know where the value of my money stays, after I ordered and paid
for a 64 Mb upgrade to my TT at the end of January. Since MABN won't give a
damn to tell me, I'd like to ask the manufacturers themselves.

Source record: 99455

Hi all!

All settled, there will be a Milan at The Nordic Atari Show here in
Gothenburg, 13th of june (At saturday) just two days before the
official release.

Many thanks to Mr A. Goukassian (FALKE) and Thomas Raukamp for your
efforts.

I will hold a seminar about the computer, its operating system and
all the special "home" apps boundled, such as Papyrus 6 Home,
Texel Home 2, Smurf Home and Pixart 4.4 Home.

Nice shot to implement real apps with a new computer, indeed.

BTW: just read some of the articles under "TOS 6.0..." about Smurf.
I've seen Smurf in action and clearly, some of the modules in it
is much faster then Photoshop (my opinion).

Info about The show at http://www.sak.nu/nas and http://welcome.to/nas98
(Please reload your cache often there)

..some other News at the show is that CAB 2.7 Demo will be released there,
fVDI (Falcon VDI), a special MyMail version and so on.

I will also hold a seminar about how to construct a webpage with HP Penguin Pro
and CAB, and how to download the pages with Fiffi to the service provider.
Partly inform about the news in ASH CAB 2.7, Emailer 1.1, PPP-Connect 1.4,
'course I've not seen them yet, just have the upgrade info.

But I have seen a snapshot of ASH Magic 6.0 Window (this has nothing to do
with the Show), they (ASH) have re-constructed the look of a GEM-window (again),
it loooks terrible nice. It also now uses a boot-up picture-logo.

: I'm wanting to setup LaTeX on my STE but I'm unsure as what files are
: needed. Looking at <atari.archive.umich.edu> and <ftp.cs.tu-berin.de>
: there would appear to be quite a few TeX and DVI related files to choose
: from, so where do I start...

: Ideally, I'd like to have it all up and running under MagiC.

Either the of CS-TeX or Lindner distributions should be satisfactory for you. For CS-TeX, just go into its directory on the ftp site and grab everything. With Lindner-TeX, you can pick and choose which archives you want. I know Lindner-TeX comes with an install program, and (it's been 4 years) I'm pretty sure CS-TeX does as well.

After using CS-TeX for most of my undergrad career, I switched over to Lindner-TeX, not only to see if I could do it, but also because it seems to be better supported by third party software. I prefer the directory layout of Lindner-TeX, it comes with more precompiled fonts (important, since Metafont is slow even on my TT), and it has 68020/68881 versions of TeX and BigTeX.

You should have no problems running either under Magic; you will need 4 megs (especially if you're running a big BigTeX), and don't count on doing a whole lot of multitasking while TeX is running. Also, set aside plenty (=15 megs) of hard drive space for a full install.

Hi !

I'm looking for the Atari ST games Llamatron, Horror Zombies from the Crypt, and Dungeon Master.... Ideally, I'd like to find the .MSA files of them (for use on the Atari ST emulator for the Power Mac, NoSTalgia), as my attempts to convert the .ST files of Dungeon Master that I have to .MSA files via DUST, simply will not work...

Any info regarding any of this will be greatly appreciated !!

Thanks !

Er, I think the "f" in "fVDI" stands for Fenix, not Falcon. fVDI is written as one of the parts of the Fenix TOS compatable replacement OS. The "f" can also stand for "fast" or "free." Have a look at the source: http://rand.thn.htu.se/~johan/fvdi.html for more information.

But this show sounds awfully cool. I just wish I were proximate enough to make it to the show.

Gï¿½tz Hoffart <hoffart@ruf.uni-freiburg.de> wrote:

> BTW: It is very common to use around 70 cols - but thereï¿½s no such RFC.

However Son Of RFC 1036 says:

4.3.2. Body Conventions

Although body lines can in principle be very long (see sec-
tion 4.6 for some discussion of length limits), posters
SHOULD restrict body line lengths to circa 70-75 characters.
On systems where text is conventionally stored with EOLs
only at paragraph breaks and other "hard return" points,
with software breaking lines as appropriate for display or
manipulation, posting agents SHOULD insert EOLs as necessary
so that posted articles comply with this restriction.

NOTE: News originated in environments where line
breaks in plain text files were supplied by the
user, not the software. Be this good or bad, much
reading-agent and posting-agent software assumes
that news articles follow this convention, so it
is often inconvenient to read or respond to arti-
cles which violate it. The "70-75" number comes
from the widespread use of display devices which
are 80 columns wide, and the desire to leave a bit
of margin for quoting etc. (see below).

Haven't as yet. Probably get the mail sent off later. The problem I have is with v7.04, and the latest English version AFAIK is v7.51. This info may be some help, then again the problem could be fixed with the later version.

> I found that later versions of HDDriver had a problem with the generic SCSI

> >> although you'll lose LFN and background DMA support.
> d>
> d> Hmm. I don't use background DMA as it seems to slow my system down,
> I wouldn't use it at all TBH!

I had it turned on so I could use it with Magic. The only problem was, with it on, the transfers with STinG slowed to a crawl with lots of dropped packets. Turned it of and the number of packets dropped reduced dramatically and the speed when up. BTW Peter, if you're reading this, I still can't use the new modules, so it isn't that that's the problem.

According to the HD Driver (English v7) manual, the values are:

TOS 1.00/1.02 256Mb
TOS 1.04 512Mb (probably TOS 1.60/1.62 as well)
TOS 4.04/Magic 1Gb

TOS 2.06/3.06 will possibly have the same 512Mb limit as TOS 1.04. I don't
know for sure, although Uwe probably does.

If it's the FM, and you have a memory expansion board fitted, you'll be able to use the SIMMs easily. If not, you're going to have quite some fun. I remember doing this to my first FM 10 years ago. I ended you soldering in 16 '41256' chips and the bypass capacitors, and 3 resistors. If your motherboard is a Revision B, the memory is under the power supply. If it isn't a Rev B, I can't give any more help.

Before I say anything else here, the following is for info only. It isn't meant to be step-by-step instructions. It's meant to show just what would be needed to do the work. If you actually use the following info and it works, all well and good. If it doesn't, don't blame me for it. It's your responsibility. It worked for me but it might not work for you.

If it is a rev B. you'll want 16 41256 chips (120ns or better) and 1nF caps, and 3x 330R resistors. I also used 16 DIL sockets so I wasn't soldering onto the chips directly. I soldered the sockets into the positions marked:

U5 U6
U12 U13
U20 U21
U24 U25
U29 U30
U36 U37
U41 U42
U46 U47

with pin 1 to the top right (facing front to back, component side up). The capacitors were soldered into the holes to the right of each socket. I can't tell you all the numbers, as some are obscured on my motherboard. The ones that are visible are:

C18
C28
C42
C53
C60
C79
C83

C120

The last things to solder are the 3 resistors in R71, R72 and R73. After they're in, check for solder bridges and then insert the chips. Check everything again, especially that the chips are in the sockets correctly (three guesses why?) and re-assemble.

If everything went well, you should now have a 1Mb FM.

>Could something inside the machine be starting to act up?

Yes. 2 bombs is a 'Bus Error' which means the error is probably in the store access. I used to get these when I had made a (bad) modification to introduce 1Mbit chips on an STM. In my case it was due to a few dry solder joints - in yours it may well be due to a failing connection to the RAM somewhere.

I can't remember what your system is, Dennis, so can't be more specific at the moment. Have to a RAM expansion board?

Anyway .... the solution would be either:

1. To drop the ST onto the desk from about 2 inches :-((((
2. To get to the circuit board and look for socketed cables/componenets. Clean these up and re-seat them firmly. :-)))))

459. MTU settings not just a STiNG buggaboo

Newsgroup: comp.sys.atari.st
Date: 1998-06-08 00:00:00 UTC
From: szhays@dogbert.ucdavis.edu
Message-ID: <6lhi8d$nr9$1@mark.ucdavis.edu>
Source record: 99478

Earlier we had a discussion about setting MTu and other settings for STiNG, and someone said he wished things were as easy as they were with Windows, and a bunch of people pointed out that Windows has problems with these setting too, only most people never know they can mess with those. Well, today CNN Online has a long article about just this, including this juicy quote "Naturally, I'm going to point my finger at Microsoft. The computer giant obviously wasn't paying attention when it set the MTU default to 1500 in the Windows 95 Registry. Lower that number to 576, and your throughput will increase substantially."

The full article is available at:
http://www.cnn.com/TECH/computing/9805/26/net.access.idg/

and a site the author recommended as having good information about MTU and appropriate MTU setings is www.sns-access.com/~netpro/maxmtu.htm

Neither do many on other platforms either, I believe from the
discussion in here some months ago. ISTR from that discussion that
Agent (one of the most popular PC newsreaders) doesn't like long
lines, nor does Netscape (it displays them but gets messed up when
quoting in replies). I *don't* intend to get into a repeat of the
previous discussion, Paul Womar's posting of the relevant docs says it
all. Emailer *should* be inserting line breaks if only out of
netiquette. Not having the option is just silly.

Cheers,
John

> Regards,

Hello !

Thanks for your reply ; I love your NoSTalgia emulator ; great work !

There IS a program to (supposedly) convert .ST files to .MSA, and it's being posted next to your NoSTalgia as a companion program on many Atari sites : it's called DUST...

The problem is, it doesn't work as advertised, in my experience, although your emulator does... Very disappointing, as I have your emulator, (which I intend to pay the shareware fees for, BTW,) :-)..., BUT have no way of converting any of the cool games for the ST to use on it !! What a drag !

So yes, it would be wonderful to have a converter that actually works to use with your marvelous program... It's a shame to have NoSTalgia, and not really be able to use it with anything.... Do you have any suggestions for me ?

Thanks, and I look forward to your next upgrade !

I just acquired a package deal on some hardware and software. Much
of it I already have or simply don't need. So I'm not leaving Atari,
though I do have the following for sale, in North America:

HARDWARE:

Atari mouse $10
Best mouse $10
Monitor Master $10
NEC CDR-25BJ 1x external CD-ROM drive
(includes All Things Falcon/GEMini Atari/
plus two adult CDs) $30
US Robotics Dual Standard 14.4k modem $15
US Robotics V.90/X2 external 56k modem ... $75

I also have many cables, so if you're looking for a cable, ask and
I'll see what I can come up with.

SOFTWARE:

AtariWorks $20
CAB 2.5 ..... $25
CodeHead package (CodeKeys/HotWire/
LookIt&PopIt/MultiDesk Deluxe/
Utilities/Warp 9 w/Extend-O-Pak) .. $20
Diamond Back 3 ..... $10
Diamond Edge 2 ..... $10
Ease 5 ..... $20
ExtenDOS Pro 2.4b $10
GFA Basic Atari 3.5/MS-DOS 4.42 ... $10
HD Driver 7.1 ..... $20
Kobold 2.5 ..... $15
MagiC 5.11 ..... $35
NVDI 4 ..... $25
STalker 3 ..... $10
STraight FAX! 2.2 ..... $15

Also, choose one each of the following for FREE, for every piece of
software you buy:

DC Utilities 2.0c
Degas Elite
Diamond Edge 1.1
DMJ GIF/Sound Lab/ReNameIt (registered)
Hard Drive Turbo Kit/Turbo ST screen accelerator
MultiTOS (Atari release)

PC Ditto 3.0 software PC emulator
NVDI 2.5
STipple graphics utility
STyle graphics utility
Tempus II text editor
TV Sports Football
Ultimate Virus Killer 6.0

All software is on original disks and comes with original manual.

Prices do not include shipping, though prices and shipping are
negotiable on multiple items.

RFC 1036 urges to use 70 to 75 characters a line.

> There are some parts where one can read that a newsreader should not
> necessarily demand 7x cols per line - long lines are allowed.

Servers are allowed to cut lines that exceed 512 characters, this is from
the RFCs. So at last there is a hard limit. But if a limit, then why not
use a sensible one.

> Unfortunately most of the Atari newsreaders donï¿½t like this, though.

It's not only Atari. It's with readers from other platforms too. Long lines
are just braindead.

> Just my thoughts. I don't really want to start a piracy debate.
>

Oh c'mon people ! For all practical purposes, the revenue generating
capability of the Atari ST is DEAD !! God knows I spent TONS of $$ on it, and

now all of these self-righteous people want to curb all of this " piracy " !! Like all of the authors of the old ST stuff REALLY CARE and are hunting down all of this " lost " revenue !! Sheesh !!

Piracy-Schmiracy ! Ok, I'm not going to lend my old Journey albums to someone that doesn't already own them, because they'll copy them, and deprive Journey of money !! Give me a break !

As a RCA-published composer, if someone is Istanbul or Iceland wants to copy a recording of MY CD from 10 years ago, then more power to him... I'm not going to be a crybaby about it and start ranting about piracy...

For one who owned an ST, and now a Power Mac, I'm glad to see sites with "available" software for my NoSTalgia emulator ! Hell, alot of the " pirate" stuff doesn't even work correctly anyway, and realistically, doesn't even compare to the current Mac and PC games... For all intents and purposes, for me anyway, it's just a trip down Memory Lane....

So just ENJOY the damn stuff, and quit complaining !!

Ghostscript is supposed to display PDF, but I think it really only works with older (lower version) PDF files. None of the US government PDF files I downloaded would display with Ghostscript. Older PDF files worked just fine. Load your PDF into Gemhexed (or a data editor, whatever) to see what the version is.

CM> Have you tried another disk in the 135? If so and it gets
CM> recognized, it is a problem with the first disk.

It just stopped being recognized by HDDriver all of a sudden, just after I started having problems with the IDE. The IDE's partition table seems to be corrupt.

CM> Do you have ICD Hard Disk Formatter? If so, the screen where you
CM> enter size of partitions, etc has a selector in the lower left corner
CM> called, WRITE PARTITION INFO ONLY. It rewrites the partition info
CM> exactly as it was before and will allow you to recover from a damaged
CM> partition sector.

Diamong Edge has a similar function. It didn't work :-(It seems DE was saving corrupt partition info all along. It would always crash after saving the info. So when I tried to load the info for the first time, I could see it was corrupt.

Connexion is usefull when you have several connections with different
(hard to remember) names. Or when testing different configurations.
Just drag&drop a ppprc file to the connexion's window or install connexion
as a .ppprc.* "viewer" with thing for example. Works great.
Bye, bye.

Do you have syslogd installed? IIRC, syslogd is not part of the n.aes
package. Which distribution of mint are you using?

>Any ideas why I can't get Connexion to find the needed files,

Make sure you have a .ppprc file in your home directory (eg in root, see
/home/root/.ppprc). This file contains pppd commands specific to each user.
Connexion runs pppd with this file as argument.
Sorry for the late reply ;-)

NO. IT DOES NOT!!!

> I have the Link II

The Link 2 is not what we are talking about, we are talking about he
original Link, the one that does not support parity. The one which I
had, which wouldn't let me use a Zip until I replaced it with a Link 2.

Am I? I was under the impression that since none of the games were available anymore, they would have been released from copyright.

I had/have no intention uf using "pirate" software. Considering that you believe them to be still in copyright, which I now conceed may be true, where does that leave the vast majority of disc images floating around the internet? Are the all pirate?

If so, how can I or anyone else legitimately obtain ST/Amiga/MSX/CPC etc. software fo use under emulation.

> Thanks, frank

Actually, I considered using a Zip + (both parallel and SCSI).
But unfortunately it would seem that the Zip + will not work in a
SCSI chain!!! You can only use it as a single SCSI device, which
is pretty stupid considering SCSI is all about chaining devices
(go figure...) This info is actually on Iomega's website, as a
tiny link on one of their pages.

Also, ICD was unable to confirm that the Zip+ auto-detect would
work properly with the Link II. I decided to play it safe and
stick to the the regular SCSI Zip.

So far it's still working...see my previous post on "Atari, SCSI
Zip and Link II" for installation and use on the Atari.

I've been checking Atari Computing Mag which did a write up on this prog in Issue #5 but it doesn't provide a web site address, simply a phone number for the UK publisher in London (Peter West on 0181 9972218).

It does say that the save-disabled demo is available from most PD/ShareWare libraries, Cix or any Atari supporting BBS connected to the Fanfiles network as SCOOTER.ZIP.

I hope this is of some help.

Regards

Jim.

> Stephen

Don't know what the problem is - I have used the Zip+ on my TT, in place of my SCSI Zip without a problem. My current setup is CDROM/SyQuest 135/Zip. I brought the Zip+ home from work to see how easy it was to set up. I put it place of my current zip and also first in the chain - HD (v5) had no problem finding it in either position.

Hi All,

I didn't get chance to log on to Channel Atari last night. Can anybody tell me how the discussion with the Milan team went?

Please E-Mail Me.

Thanks.

Regards,

Ben Hills.

In addition to the other responses, note also that there were quite a
few mice made for both the Amiga and the Atari. They just had a switch
on them to swap some line(s) around.

I should be getting my 1.3Gig Toshiba IDE tommorrow. Whats the ideal sector size for fastest disk reads with TOS 4.4? I don't care if I waste some space due to larger sector sizes. I'll divide it into 5 partitions.

Thanks,
Dave

I cannot even find the program on the page as all the graphics come up as
broken on my Mac at work using Communicator. I did download it earlier,
though. Would you like me to send it as an attached e-mail to you,
Dennis? It is in *.ZIP format. What would be even better is if you'd
consider writing your thoughts on the program down for ST Informer readers
;-). Regardless, I'll send the prog to you anyway if you want it.

>software fo use under emulation.

The disc images, a vast majority of them, are pirate. Some people have
released the right to them like the authors. Shameless plug, but read the
ST Informer article on Copyright this month. They last a long time.

It is another issue if the companies care about pirated software being on
the Web. Since they don't care about the ST market, they probably won't
bother to chase down images of their software. It is still illegal,
though.

To use disk images, you should own an original copy. This is the same
with the 2600 emulators out there.

Hope this helps! If you need sources for original software, check out
www.myatari.com or the Computer Dungeon for starters. If for no other
reason, you should try not to pirate copies of software because some Atari
delaers are making these old titles available for you and this is how they
make money. I'm not going to argue, though, that it is possible to find a
copy of every old Atari title.

Another GREAT source is right here in this group. Offer to buy a copy and
someone might just have one.

Just my thoughts. I don't really want to start a piracy debate.

This doesn't help you right now, but I plan to edit the captured file I have of the conference and post it to the ST Informer site ASAP. It was a good time as far as I am concerned. Lots of encouraging information in my view.

I honestly think we should give the Milan team a big round of applause and e-mail them our support. It is refreshing to see a team so involved on the groups and keeping in touch with the Atari community.

Good job!

There was a range of accessories under the banner 'Technoplus'. There was a joypad, mouse and pen, all in bone white. Good response on the joypad, though I never had the mouse, but it was switchable. I'm actually using a mouse made by 'CPC' which is also switchable, with a good heavy feel in the hand.

510. Where does one buy an Atari?

Newsgroup: comp.sys.atari.st
Date: 1998-06-09 00:00:00 UTC
From: mikhol74@aol.com
Message-ID: <1998060915482200.LAA06687@ladder03.news.aol.com>
Source record: 99367

Good day all,

I have recently pulled my 800XL out of mothball. It has been probably 10 years since I have used it. This was several weeks ago. I then went on a business trip to New Orleans, where I saw a car with an Atari sticker on the window (a large one at that.) This kind of brought me back into the Atari fold again. I was wondering if anyone could tell me if you can buy Ataris still. The last I heard, they were out of business, but their final computer was a Falcon. Are these still available, and if so, how much are they?
A guy at work told me that he had seen an Atari ST laptop. Is this true, are there laptops out there? If so, how much do they cost, and are they still available?
And finally, where can I get one of those Atari stickers?

Thank you for whatever help you can give me.

Michael
mikhol74@aol.com

Drop this TT/030???? Where's my shotgun? Now doing a clean up inside?
that might be, but I also have gotten less of them now that the wind
storm we've had the last 4 days is gone. What bugs me the most right now
is not being able to D/L that web page designer program! Oh ya, I turned
the graphics OFF in CAB, and I also deactiveated NeoDesk, now, in single
TOS mode and normal desktop, CAB runs faster even with graphics on. With
graphics off I can get pase some areas before CAB bombs out.

I think my next step is setting up my Falcon, BUT, with only one 44meg
cart left and only a ST157 on it, space is to limited.

I take allways the default from HDDriver7.
Works fine.

520. TT030 and X/Z-control problem ...

Newsgroup: comp.sys.atari.st
Date: 1998-06-09 00:00:00 UTC
From: dipching@ping.be
Message-ID: <357d9a524fee30@ping.be>
Source record: 99377

I have just bought a second second hand TT030, everything is OK while testing it with the TT030 diagnostic cartridge from Bestelectronics

... but after having installed everything I needed, I remark it's almost impossible to make X or Z-control accessory work !

A really strange problem occurs, when booting with X/Z-control with only the GENERAL.CPX, the control accessory is available but when trying to open the GENERAL.CPX, nothing happens ....

If I try to boot with all the cpx I need, I receive a nice "two bombs" ...

Also, under Geneva, if I try to run the X/Z-control after having booted, the same things appear ...

Thanks for any answer ...

Jo

521. How do you play WAV files clearer on the STE

Newsgroup: comp.sys.atari.st
Date: 1998-06-09 00:00:00 UTC
From: Deano@zetnet.co.uk
Message-ID: <357e9646.11515914@news.zetnet.co.uk>
Source record: 99378

I made some samples on the PC, saved them as PC Wav files (speed
11025, mono) and they play fairly well under STOS using STFM replay
commands. However, when I play them under the STE they don't sound
very clear at all. Any idea what to do?

Do you want a program that plays your WAV files? Take sWAV by Christoph Bartholme (<christoph_bartholme@ka2.maus.de>) or GEMJing (Download: http://members.aol.com/hoffart/zsoftware.html).

> pick them to order.

Go to http://www.esc.de/homes/guivol/jpeg-bin/ and download jpg6btos.zip,
the TOS binaries of The Independent JPEG Group's software. Within the
archive are TTP-based JPEG utilities.

To scale a JPEG, run djpeg.ttp with the command line:

-scale 1/8 filein.jpg fileout.ppm

This will create a scaled version in ppm (pbmplus color) format. Now take
fileout.ppm and run cjpeg.ttp with the command line:

fileout.ppm fileout.jpg

This will convert the scaled ppm graphic back into a JPEG, which
can now be used in your HTML as a thumbnail to the full graphic. Scaling
can also be defined using 1/1, 1/2 and 1/4. All this is the bare minimum
you need to do (read the docs for full usage).

525. LS-120 floppy drive supported?

Newsgroup: comp.sys.atari.st
Date: 1998-06-09 00:00:00 UTC
From: Ken Macdonald <macdonald@cfcsc.dnd.ca>
Message-ID: <357DA623.65CDD961@cfcsc.dnd.ca>
Source record: 99382

Hi.
As some may be aware there is a floppy drive out that
read/writes 720KB, 1.44MB, 2.88MB, and 120MB floppy
disks.
I notice Milan and/or Phenix is supporting these drives as well.
Is it possible to retrofit these drives to an ST, TT, Falcon,...?
Can the Xbios handle it? Would something like HD Driver be needed?

Hi

Sounds like a corupt cpx or info file never had any problems with Z
control etc the config cpx is a bit dogy and can cause all sorts of
problems.

yes, there is such a 'program'
It is called 'translat.ttp', and comes with ExtenDOS.
you call it from the extendos.inf file in the auto folder and in runs
at the same time as ExtenDOS. it translates upper and lower case
characters,
and can also handle Mac CD's (so it says, I've never tried a Mac CD)

Uwe Seimet (us@ooc.de) wrote:

: What's your hard disk driver? As far as I know for large partitions and
: the MinixFS either CBHD, HuSHI or HDDRIVER are required.

i use ICD PRO driver v6.5.5 on a falcon with 4.04.
an old version of minit gives for a 64meg partition:
Lrecno supported by this setup (this implies xhdi support according to the
(lost) docs that came with it, if i recal correctly)
but for a 150 meg partition i get:
Sorry unsupported sector size: 4096
kgmd's minit only runs under mint and for 64meg partitions it gives:
.... logical/physical lrecno error, XHDI not supported
and for 150meg partitions it adds:
.... SCSI bus: device 1: (non-removable) ??????
Fatal Read error -15 block 0. ??????

there are no problems running tos, except that i prefere mint, but
running mint using the 150 meg removable and the problems start.

i use the KGMD setup, i.e minixfs version 0.60 patchlevel 11, modified
for KGMD. i'm running freemint v1.14.7-BETA.

The Atari definitely can't boot from the LS-120. Unless a hard disk
driver (HDDRIVER) is installed, you can't acces the LS-120.

> It is version 6.2. I was told that v.6.2 was the last update. You
> mention v.6.22. If this is a update to v.6.2, then let us know what
> is new in this version.

It was 6.22! As my german kind of sucks, here is it in original german :)

Erweiterungen seit FALCON SPEED V6.21
---

1 Die Ansteuerung von externen SCSI Laufwerken wurde optimiert.
Fehlerhafte Schreiboperationen bei einigen Laufwerken, sollten
nun nicht mehr auftreten.

Erweiterungen seit FALCON SPEED V6.22
---

1 Auch grosse IDE Festplatten mit 63 Sektoren pro Spur k�nnen nun
ganz normal betrieben werden. Bisher kab es Probleme beim Booten
von DOS.

Btw: I tried to run the PC version of Monkey Island just for fun, and guess
what - it worked!
In 256 colors too! Allmost playable :)

/Peter

>Like all of the authors of the old ST stuff REALLY CARE and are hunting down
>all of this " lost " revenue !! Sheesh !!

There is still revenue for the shops that have these games in stock. Lots of people also have 2nd hand games and are trying to sell them cheap, often to buy NEW Atari software or hardware.

By proning piracy, you are ripping off anyone who actually has paid money for original games.

>
>Piracy-Schmiracy ! Ok, I'm not going to lend my old Journey albums to someone
>that doesn't already own them, because they'll copy them, and deprive Journey
>of money !! Give me a break !

No, but if the record company decides to re-edit those albums on cd or whatever, then they will certainly not have the same opinion. And what about the 2nd hand record dealers who try to make a living too ? You might as well just go in and set their stock of old records on fire and give away bootleg tapes on their doorstep.

>
>As a RCA-published composer, if someone is Istanbul or Iceland wants to copy a

Yeah, but what if you suddenly become famous and start selling records by the million, and all of a sudden you find guys giving away MP3s of your records on the net or selling pirate CDs ? Also, what do you think your record company will think ?

Well, maybe for you. But you are ignoring those for who the ST is still TODAY'S COMPUTER. Many people still use it, and many also try to make a living out of it. The support is more fragile everyday, and promoting software piracy is only just killing off what's left.

Look at your Mac, and imagine that tomorrow all the software you paid HARD money for yesterday becomes all of a sudden worthless. Imagine that one day, you might want to sell it to upgrade, and you find that it's has no value left because all the software is free on the internet.

Cheers,
Nick

Hello. Unless you have an STe, it won't run. I am not sure if you do or
not because in the topic header you mention the e, but in your message you
do not. Anyway :-), here in the States, Computer Dungeon had this product
listed. I'm not sure how expensive shipping and all that would be.

Their URL is http://www.mcs.net/~isis/dungeon/dungeon.htm.

Hope this helps you out.

I recall seeing a message in one of the Amiga newsgroups that
indicated the Zip Plus would work in a SCSI chain, but only if it were
the end device (i.e. nothing plugged into its pass-thru port).

Of course, if you shop around, you can just about pick up a SCSI zip +
a parallel Zip drive for about the same price as a single Zip+
(especially if you do not mind refurbs).

>>
>> 38400 is the maximum on Modem 2. 57600 is not available on a TT Modem 2.
>
>Ah, that's the crap port, which does 76800 bps instead ? ;-)

ROTFL!

Modem-2 speeds:

TT: 19200, 38400, 76800, 153600.
MEGA-STe/Falcon: 19200, 38400, 57600, 115200, 230400.

Yes, the TT has oddball speeds based on multitples of 19200,
because it was Atari's first attempt a new technologies such
as the SCC, so a lot of features are "best guess".

However, the SCC can be clocked at 14 MHz, like the Hades, and
this modification is recognized by HS-Modem automatically. The
result is a increased speed limit, up to 921600 theorical.

This simple modification is described on "The TT030 Homepage".

HELP! I am going crazy, or my computer is! I have a TT 10+16, and occasionally use autosort. All of a sudden, it has stopped working! The program loads ok, and displays the c:/auto partition correctly, but when i try to move anything around, the program freezes DEAD! I have reformatted my boot disk entirely, and reloaded all files. It does the same with sveral different copies of autosort, and also with the sorting function in mouseboot4, and in other directories than auto! I have booted with EVERYTHING out of the auto folder, and no accessories.
HOWEVER, dirsort, another file sorting program works FINE! True, i can forget autosort, and use dirsort, But it is driving me crazy why it has SUDDENLY stopped working.
If anyone has experienced this before and has some idea what is wrong, PLEASE let me know.

>different programs?

Actually, having a separate transportation layer is quite common on
this platform if you use an offline reader. Apologies for any
inaccuracies in the following table: I'm no expert and haven't used
all the options (including Net2Net - Fido technology passed me by so
I've never had the urge to use non-internet mail and news software).

```
OLR | Transport options
~~~~~~~~~|~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Snews/ | NOS
Simple | STiK/NEWSwatch/POPwatch
mailer | STinG/NEWSwatch/POPwatch
~~~~~~~~~|~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Oasis1 | NOS
| STiK/NEWSwatch/POPwatch
| STinG/NEWSwatch/POPwatch
~~~~~~~~~|~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Oasis2 | ICE
| STiK/NEWSwatch/POPwatch
| STinG/NEWSwatch/POPwatch
~~~~~~~~~|~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Okami | NOS
| STiK/NEWSwatch/POPwatch
| STinG/NEWSwatch/POPwatch
| UUCP, SOUP, MiNTnet transport options etc
~~~~~~~~~|~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Net2Net/ | NOS
Fido | ICE (?)
```

```
reader | STiK/NEWSwatch/POPwatch
| STinG/NEWSwatch/POPwatch
~~~~~~~~~|~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Firestorm| STiK/Babel
| STinG/Babel
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

The only difference with Net2Net is that it isn't an OLR in itself but a conversion layer between Fido OLRs and internet message transport software. Clients which integrate offline reading and transport into one program (Antmail, Mymail(?), NEWSie) are actually in the minority.

Hi Andy!

Funnily enough, the ST is Y2K compliant, and has been since day one. Tests of lots of programs don't reveal many problems.

The only problem program that I know of is the Time/Date setting program for the battery-backed clock in the Forget-Me-Clock cartridge. This only accepts two-digits for the year. However there is a software patch knocking about that gets around this, which goes in the auto folder

Email me if you require this patch, and I'll send it on.

Personally, I use Atari computers daily -- they are certainly not dead for
me. I have no objection to using copyrighted software without paying if there
is no opportunity to buying it from anyone, anywhere. I take substantial
objection to people encouraging others to bypass the new & used software
inventories painstakingly collected for sale by our remaining dealers.

The authors may or may not care about their intellectual property -- the
dealers probably care about their physical property -- and I care about such
things as societal obligations.

I do enjoy the #@%^ stuff -- I just PAY for it.

The ST clock is O.K. to 2028. Your software is another issue, though. Set the clock to 2000 and check. Galen (Head YACcer, Yolo Atari Club)

571. Phenix 040 Workstation

Newsgroup: comp.sys.atari.st
Date: 1998-06-10 00:00:00 UTC
From: Jim Donovan <jtdon@worldnet.att.net>
Message-ID: <6ln3k5$lv9@bgtnsc02.worldnet.att.net>
Source record: 99276

The following is from the Centek E-Mailing:

```
*********************************
* PHENIX 040? Workstation *
* FIXED FEATURES V.1.0 <-- YEAH !! *
*********************************

= MAY 1998, CENTEK

This computer is NOT a TOS clone or a PC compatible !
It is a NEW computer including NEW HARDWARE and NEW
OPERATING
SYSTEM named DOLMEN?.
A software EMULATION support into the system allows to
run
softwares from the old operating system named TOS?.
---------------------------------------------------------------

- MOTOROLA? MC68040? at 40 MHz (BCLK).
NOTE : The 040 instruction execution units are
CLOCKED by
the BCLK and NOT the PCLK (80 MHz) - See Section 10
page
10-4 of the MC68040? DATABOOK (M68040UM/AD Rev.1)
and our
technical files on this site !
By example : - Afterburner? is a 040 at 32 MHz !
- Hades? 040 is a 040 at 32 MHz !
- Milan? 040 is a 040 at 25 or 33 MHz.
People who present the 040 as a x2 (i.e 64 MHz)
clocked
processor are liars !!!
CENTEK refuses to use the same 'commercial' politic
!

- Can be updated with a 060 at 80 MHz (BUS at 40
MHz).

- BUS : 32-Bit DATA / 32-Bit ADDRESS / 40 MHz Frequency.

- Three SIMM sockets : 32-Bit RAM up to 192 MB.

- MOTOROLA DSP 56301? at 80 MHz (80 MIPS !).
- 24-Bit HOST port with 3 clock cycles access :
80 MB/s DMA transfert (or 26 MWords (DSP 24-Bit
words).
- On-Chip Memories : - 2048 * 24-Bit X Data RAM.
```

- 2048 * 24-Bit Y Data RAM.
- 3072 * 24-Bit Program RAM.
- 1024 * 24-Bit Instruction
CACHE.
- 192 * 24-Bit Bootstrap ROM.
- Off-Chip Memories : 384 kB 15ns SRAM (=128 kWords
24-Bit).
- External DSP connector (Falcon signal upward
compatible).
- HD SUB-D 44 pins.

- MOTOROLA MC68360 - QUICC? at 40 MHz.
(QUICC? : QUad Integrated Communications Controller).
- CPU 32 Core (68030) - 7.2 MIPS at 40 MHz.
- 32-Bit DATA and ADDRESS lines.
- Four General-Purpose 16-Bit Timers.
- Sixteen 16-Bit software Timers.
- Two Independent DMA (IDMA) with Single Address Mode
(up to 80 MB/s at 40 MHz per DMA channel).
- Communications RISC Processor (35 MIPS @ 40 MHz)
with 14 DMA
channels :
- Ethernet/IEEE 802.3 Optional (Full 10-Mbps
Support).
- A motherboard slot is dedicated for this option.
- 32-Bit DMA transfert.
- RS-422/GeoPort? up to 4 Mbit/s full duplex.
- Mini-DIN 9 connector.
- LocalTalk? and AppleTalk? backwardly compatible.
- 6 kV ESD protection.
- 32-Bit DMA transfert.
- RS-232 up to 1 Mbit/s.
- Standart SUB-D9 conector.
- 15 kV ESD protection (European standart).
- 32-Bit DMA transfert.
- Full CENTRONICS? IEEE 1284 parallel port.
- Up to 4 Mbit/s half duplex.
- 32-Bit DMA transfert.
- TWO MIDI (In/Out/Thru) channel.
- DIN-5 standart connectors.
- 32-Bit DMA transfert.
- One SPI? channel.
- The 3 pins are on the DSP connector.
- 32-Bit DMA transfert.

- THREE 8-Bit ADC channels for external DATA
acquisition.
- The pins are on the DSP connector.

- PCI? controller : - MASTER and SLAVE.
- Two DMA channels (up to 132 MB/s).

- PCI 2.1 compliant.
- Support of the PCI 3.3v signaling.
- Support of the I2O? new PCI messaging.
- Two PCI slots.

- USB? controller for 2 HOST USB connectors :
- 32-Bit DMA transfert.
- one is used by the keyboard.
- the second is available for all the USB
peripherals...

- 128 kB FLASH Eprom containing the BIOS (SET
UP/AUTOTEST/BOOT).
The FLASH enables the software updates.

- ULTRA-SCSI bus (SCSI Controller with 16-Bit DMA) :
- The SCSI bus maximum rate is 20 MB/s.
- The HOST DMA maximum rate is 40 MB/s.

- VIDEO : S3 VIRGE DX with 4 MB of EDO RAM.
- This card occupies one of the two PCI slots.

- SOUND : You can choose a card between :
- Stereo 16-Bit 33/44.1/48 kHz :
- 2 CINCH Inputs / 2 CINCH Outputs
- 1 Mini-Jack for a microphone.
- 1 PC compatible GAME port
&
- Professional 24-Bit 48/96 kHz Card including
:
- 8 INPUTs / 8 OUTPUTs, SPDIF?/AES?/EBU?
Interface.
- 2 others MIDI channels

- VOCAL : TI? Speech Processor for the
Speech Recognition, Speech & Music Synthesis,
Access Control, and Software ONLINE HELP !
** This feature will be fixed later **

- TIME : Timekeeping? module with 242 bytes of NVRAM
(Non Volatile
Ram) with RESUME mode to Wake up the PHENIX?.

- SLOTS : - Two PCI slots (one is used by the Graphic
card).
- One DIRECT 040 Processor slot for Hardware
expansions :
- others CPU (040/060) card.
- PowerPC? card (to mute the softwares to
.........)
- others DSP 56301 card.
- VME? bus.
- Memory adding card (up to 256 new MB).

- One AUDIO slots (it is used by the Audio
card).

- KEYBOARD : USB Keyboard !!
- This one may be a KEYTRONICS? Natural?
keyboard.

- MOUSE : PS/2 mouse.
- it is connected to the USB? keyboard.

- CASE : Standard Middle ATX 2.0 Tower.
and CENTEK desktop case...later.

- POWER : ATX 2.0 compatible.

- OPERATING SYSTEM : DOLMEN?
- Multi-tasking
- 100 % 040 ASM code !
- AES & VDI backwardly compatible.
- The VDI uses all the 2D/3D S3
VIRGE? functions.
- Easy to update by the Flash and
the HD.

****
* FINAL USERS INFORMATIONS *
****

-> The PHENIX complete configuration includes
- MOTOROLA 040 CPU (may be updated to 060)
- LS120 Drive (120 MB disks & floppy 1.44 MB
compatible)
- 16 MB 32-Bit RAM.
- S3 VIRGE DX 4MB 3D Graphic card
- One 16-Bit Audio card.
- 3.2 Go ULTRA SCSI Hard Drive.
- 24x IDE CD-ROM Drive.
- USB 105 touchs NATURAL? Keyboard.
- PS/2 mouse.
- ATX Middle Tower.

PRICE : 9990 FF (French VAT included).
1380 USD (no local taxes included).

OPTIONS :
- MULTISYNC 17' 0.26 pitch monitor : + 2690 FF
- DVD-ROM? drive : + 1700 FF

-> MOTHERBOARD ALONE (with the 040) : 4990 FF
690 USD

****
* HARDWARE & SOFTWARE DEVELOPERS INFORMATIONS *
****

COMPLETE configuration : 6490 FF TTC (including
French VAT).
MOTHERBOARD ALONE (with 040) : 3290 FF TTC.

These configurations include :
- CD-ROM (AND PAPER) complete Documentation (Software
and Hardware
(slots)) and SYSTEM HOTLINE (Phone/E-mail) for the
developers !
- CD-ROM with the developer package :
- CENTinel? The ultimate 040/060/DSP56301/68360
debugger.
- CENTasm? The 040/060/DSP56301 assembler.
- CENTedit? The universal color editor.
- FASHION? The RSC builder for DOLMEN.
- GNUC++ 040 pack.
- and the other things some developers will bring.

****
You'd like to become a PHENIX DEVELOPER ?
You will need a CONFIDENTIAL agreement !

Hi Niall:

I have been using the BJC-4000 for 2 years with my MegaSTE 4 with
Calamus. The output in color is pretty good although the print speed is
quite slow. The results are quite good though!

Niall Moran a ï¿½crit:

> I was wondering if anybody has had any success getting colour output
> from the Canon BJC240? I have used it fine in black and white but

I think the problem is TOS 1.0 - not sure about STiK, but the STinG
docs specifically state that TOS 1.0 isn't supported (1.2 onwards is
OK). This is due to the ridiculous number of bugs in TOS 1.0, IIRC.

Sorry to be the bearer of bad news,
John

Can't say for all clock carts but the Forget-me-clocks will stop
functioning in the year 2000. The clocks themselves are OK at
rollover, but the setting software can't set dates past 1999. Hence in
18 months they will all be useless, unless some kind person comes up
with a solution (such as an auto program which changes the year after
the clock has been read). *HINT to those wunnerful programmers out
there!* :)

Drop this TT/030???? Where's my shotgun? Now doing a clean up inside?
that might be, but I also have gotten less of them now that the wind
storm we've had the last 4 days is gone. What bugs me the most right now
is not being able to D/L that web page designer program! Oh ya, I turned
the graphics OFF in CAB, and I also deactiveated NeoDesk, now, in single
TOS mode and normal desktop, CAB runs faster even with graphics on. With
graphics off I can get pase some areas before CAB bombs out.

I think my next step is setting up my Falcon, BUT, with only one 44meg
cart left and only a ST157 on it, space is to limited.

Iomega however say that using it in a SCSI chain may lead to data
corruption, they are offering to swap each Zip+ with a normal Zip and a
box of 6 disks.

these are ide type things, i think the let down is/was that you could
not boot from one,but latley at shows i have seen them labled as
bootable,but by atari i don't know

you can bet if they are of use to ataris, Mr seimet and hd driver
will be on the case

as hard drive technology has come along quite a lot,floppys seem
to have stood still for years,it would make sense if somthing of that
size could do more than read two types of disk

Something seems to be happening at the Wizztronics
web site.

http://www.wizztronics.com/pr02.htm is online
http://www.wizztronics.com/ sends an error,
normally the default.htm page.

I'll be keeping a close eye on this site for the
next few days.

There is a module for Cab which will create thumbnail images. I dunno which cab versions it comes with though. Failing that you'll have to resort to a graphics package to scale them down.

There was a discussion about this a while ago. Our good Dr Uwe is
apparently working on getting these drives to work.

They usually have 2 connectors, one for the PC floppy connector, and one
IDE. The problem would then be a driver problem so that there is no
conflict between the two.

Cheers,
Nick

Hi!

I don't use NoSTalgia, but I can offer you some program which runs on ST platform. You can download it from my page (JAY Software).

It is well known MSA archiver and the new version knows how to handle ST files too. It allows the directory listing and many more features.

regards

Stan

Right, and the 'official' reference can be found here:

http://www.faqs.org/faqs/jpeg-faq/part2/section-10.html

> To scale a JPEG, run djpeg.ttp with the command line:

> can now be used in your HTML as a thumbnail to the full graphic. Scaling
> can also be defined using 1/1, 1/2 and 1/4. All this is the bare minimum
> you need to do (read the docs for full usage).

Right, the IJG software provides this optimized downscaling feature which
exploites internal JPEG properties and thus is preferable to other more
general tools, if you can be content with the given range (1/2,1/4,1/8
- which is quite useful for Web applications).

Under Unix(-like) shells, you can get away with the intermediate ppm file
and just pipe the output of djpeg to cjpeg, with appropriate arguments.
For example, I often use commands like

djpeg -scale 1/8 < image.jpg | cjpeg -opt -q 80 > image-thumb.jpg

in the shell or in scripts (with complete HTML output) to generate
smaller versions of an image.

Regards,
Guido

595. EZ135 works, new IDE don't

Source record: 99322

First, thanks to all who responded to my questions about the EZ135 and IDE drives. As far as I can tell the EZ135 was not being recognized because of a hardware problem with my old IDE drive. So I bought a used 1.3Gig Toshiba IDE, and of course it don't work. The EZ135 suddenly works again! :-)

HDDriver doesn't recognise the drive at all, and Diamond Edge says,"Could not read physical sector 0" when I force it to partition IDE I0. Is this a TOS 4.4 problem?

Help!

>all of this " lost " revenue !! Sheesh !!

I sounded self-righteous? I didn't think so. Someone asked a question whether or not it was illegal to download disk images of commercial software. It IS illegal. I did mention that not many companies are going to care. I'm not saying that people who pirate are bad people. If that were the case, I wouldn't be friends with almost anyone I know who owns a computer :-).

That said, many dealers sell old software for the ST. Are you potentially ripping them off? I'd say, yes. Why should they support a community that does not support their efforts? I like the fact that I can buy a classic piece of software and actually get the packaging and documentation. If it is not worth the dealers' while to carry old software, though....

If I were a dealer specializing in used or hard to find items, I'd be discouraged by people making commercial software available on the Web.

>Piracy-Schmiracy ! Ok, I'm not going to lend my old Journey albums to someone
>that doesn't already own them, because they'll copy them, and deprive Journey
>of money !! Give me a break !

There is a record store by my house that sells all old vinyl. I appreciate that and give him my support; I don't really care about Journey. There are still people who could benefit from my support, though, and to ignore that record dealer is, in my opinion, callous.

>As a RCA-published composer, if someone is Istanbul or Iceland wants to copy a
>recording of MY CD from 10 years ago, then more power to him... I'm not going
>to be a crybaby about it and start ranting about piracy...

Like I said, many authors have made their software freely available and I respect that.

>For one who owned an ST, and now a Power Mac, I'm glad to see sites with
>"available" software for my NoSTalgia emulator ! Hell, alot of the " pirate"
>stuff doesn't even work correctly anyway, and realistically, doesn't even
>compare to the current Mac and PC games... For all intents and purposes, for
>me anyway, it's just a trip down Memory Lane....

"Doesn't compare" is not really an argument for piracy, sorry.

>So just ENJOY the damn stuff, and quit complaining !!

I do enjoy it and was not complaining. I was just pointing out the legalities and that there are some fine people who could benefit from the Atari communities' support.

The Year 2000 issue on the Atari is software related, so it all depends
on the software you are using, since STs didn't have a real time clock
anyway.

There shouldn't be any problems with terminal software, but if there is,
change the software!

Cheers,
Nick

Which would that be (and compared to Photoshop running on what hardware)?

Anyway, most comparisons with Photoshop fail to take into account that
there are different ways to do _almost_ the same thing. There is a huge
performance difference between point sampling, linear interpolation
and spline interpolation when scaling/rotating/warping an image for
example.

>fVDI (Falcon VDI), a special MyMail version and so on.

As was noted by someone else, that should be the Fenix/Free/Fast VDI.
It has no features that are specific for the Falcon at this time.
The 15/16 bit driver works on graphics cards as well and the shadow
screen concept just needs a fast processor with fast local RAM and
slow screen access, such as my Falcon+AB040.

Anyway, I will indeed be at NAS and will have a release version of
fVDI v0.85 with me (with luck I'll get the time to finish up the
non-solid blits and real text acceleration for the 4 bit driver...).
Unless someone gives me a ride, I won't have a computer myself, though.

I won't be giving any official seminars about fVDI, but if anyone is
interested in talking about it (hopefully, with the intention to help
writing some device drivers), please look me up.

if your using them as dumb terminals it realy doesnt matter if you
have a battery backed clock just set it back.
>>
>> Andy.

>The Year 2000 issue on the Atari is software related, so it all depends
>on the software you are using, since STs didn't have a real time clock
>anyway.
st's have clocks all right, in the keyboard manager chip. but they are
volitle. but you can get clock cards; plus there is a simple mod you
can make with a 7400 and a rechargable battery to your keyboard (but
some games re-set this timer so its to so robust as a cartiridge/scsi
adapter clock). there were non volatile clocks in the MSTE and falcon.

calls to get time date from any version of tos is fine into 2038 (or
similar)

of course this doesnt mean all software is complient, a year
represtend as two digits can still give problems with > & <
comparisons if the programmer didnt think to check if the date is < 85
first.

608. Mint Question...

Newsgroup: comp.sys.atari.st
Date: 1998-06-10 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <6lmar0$h80$1@news.campus.mci.net>
Source record: 99335

Does anybody know if Mint (KEMD revision 2) is compatible with
the ICD Pro HD Utils software? I've been trying to install it
to my G: partition (194 megs), and I pick the v2 filesystem, and
30 letter long filenames, but when it actually goes to do the Minix
partition it gives this error:

physical lrecno error

and quits with a -1 exit code... Any help would be much appreciated!

HI,

I just finish a new program for atari and it can be downloaded now.
The name of this program is st2disk and the address (temporary) to
download it is http://wwwusers.imaginet.fr/~nowak/st2disk.zip

I have also uploaded this program on the ftp sites :
ftp://ftp.funet.fi/pub/atari
ftp://ftp.lip6.fr/pub/atari
ftp://ftp.cs.tu-berlin.de/pub/atari

This program is made to recreate floppy disks from pacifist image
file. It is compatible with all the atari and clones, work under
multitasking system and it is free.

Bye,
pascal

Thank you very much for any help attempt ...
I simply had a back-up problem from my first TT to my second one ...
on an old Syquest 44 cartridge I had a lot of corrupted files ...
Now everything is all right !
Nevertheless Thank you !

The sector size doesn't have a relevant influence on the speed.

> Is it possible to retrofit these drives to an ST, TT, Falcon,...?
> Can the Xbios handle it? Would something like HD Driver be needed?

Yes, HDDRIVER is the only driver so far that supports the LS-120. I have
one of these drives connected to my Falcon. You can't connect it to the
ST because there is only an ATAPI version available (as far as I know),
i.e. it has to be connected to the IDE port.
Note that HDDRIVER 7.53 is required for the LS-120. Older versions don't
work.

There will be a new mouse adapter on sale soon in the UK that will allow any PC mouse to run from the Atari mouse port :-)

It will also allow the use of Trackballs, touch tablets etc :-)

As long as it is a serial mouse, it will work :-)

I am producing and distributing them in the UK and Europe :-)

Watch this space for more details soon :-)

621. Y2K Solution - Help Needed.

Newsgroup: comp.sys.atari.st
Date: 1998-06-11 00:00:00 UTC
From: sgm23@eng.cam.ac.uk
Message-ID: <6lo7dvnop1@pegasus.csx.cam.ac.uk>
Source record: 99198

I am trying to find a solution to the year 2000 problem, intially for users of clock cartridges.
To do this I need a Forget-me-clock cartridge complete with software and a non complied source code for the software, I also need to know what language it is written in. Does anyone know where I can get these from in the U.K.?.
Kevin Dermott was kind enough to take the case of his cartriges and inform me that the chip used is a Dallas DS1215, if your reading this - thanks Kevin.
If a few other people would be kind enough to do the same and e-mail me the results it would be most useful, basically this is just to try and comfirm that the DS1215 is the only chip used.

Cheers, Stephen Moss.

>that might be, but I also have gotten less of them now that the wind
>storm we've had the last 4 days is gone.

Ah, ha! If your mains cabling is above ground anywhere it is probable that the bombs were caused by mains spikes - either arcing, shorting or, maybe, lightening interference. If you reckon this might be the case you can get supply filter gizmos which will get rid of most of it.

>What bugs me the most right now
>is not being able to D/L that web page designer program!

So I've noticed! If I had a copy myself I would have e-mailed it but I think someone else is doing this anyway.

>I think my next step is setting up my Falcon, BUT, with only one 44meg
>cart left and only a ST157 on it, space is to limited.

Mmm .. great for graphics, though.

I have devised a cartoon Character called
Millie the Millenium Bug who is copyright free.
Make ads of Millie stamped on computers
and show the computer meltdown in
a paper spew jam smoking burning down your
business in 2000. Millie maybe merchandiced
freely as soft toys or stickers or on T-shirts etc.
iced triple donuts etc. Stick Millie on all non 2000 compliant
software and hardware or on your web page.
Millie can be found on my web page for download right click the
mouse on Millie the Millenium Bug. Click on Millie to get
various sized Graphics and styles of Millie plus window metafile
formats for download.

I never had any success getting my copy of the ICD Pro Utils to work
with Minixfs (specifically, minit). An older version, on a small
partition (<16 megs) did work, but on big partitions (~60 megs) both
versions yakked. I finally gave up and installed CBHD, which works just
fine, and switch back to the ICD driver on the rare occassions I need to
re-partition or otherwise mess with my hard drive.

Still, I would be interested to hear of other peoples' success stories,
since I do prefer the ICD driver.

: with a newsreader, such as NEWSie. Thanks for any input...

Yeah, there's an excellent search site that trawls Usenet space weekly,
generating a list of servers. You can search it by newsgroup (to find
what free servers carry the newsgroups you are interested in). They are
also rated by speed, longevity, etc. The URL is:

http://www.jammed.com/~newzbot/

The free servers currently listed as carrying c.s.a.st include (there are
about 65 of them):

631. ST Plus Fanzine #29

Newsgroup: comp.sys.atari.st
Date: 1998-06-11 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998061116372800.MAA28567@ladder01.news.aol.com>
Source record: 99208

The June issue of ST Plus Fanzine is now available for purchase from The Computer Dungeon.

Issue #29 (#5 print) features: Software Reviews, Atari Emulation on the PC, DTP Hints & Tips, HTML Tutorial, Web Page Reviews, Diskmag Reviews, User Group News, Atari News, and much, much more!

The June issue of ST+ is available for purchase for just $2.00 which includes shipping, or receive the current issue **FREE** with any purchase you make from The Computer Dungeon.

For more information or to order ST+ #29, contact The Computer Dungeon at: 708-547-7085 10am to 5:30pm CST M-F, or visit our website at: http://www.mcs.net/~isis/dungeon/dungeon.htm

Support those who support us by purchasing a copy of ST Plus Fanzine and PLEASE drop a "Thank You" Email to the staff of ST+ and let them know you appreciate all the EXCELLENT work they're doing.

632. Atari ST-Falcon Shareware Games

Newsgroup: comp.sys.atari.st
Date: 1998-06-11 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <1998061116474200.MAA25419@ladder03.news.aol.com>
Source record: 99209

THE COMPUTER DUNGEON has many full version Shareware games available
for purchase for your ST/STe and Falcon030.

Titles include:

Falcon: Running, Double Bobble 2000, SkyFall Plus, and Conquest of Elyisum 2

ST/STe: Realms of Reality, Annex, Mole Mayhem, War-Special Edition,
H.E.A.T. Wave, Curse of Azriel, Cybernation 4-Game Pack, and many more.

All titles are **FULL** versions that are ready to run/install and come with
printed instructions.

To find out more information or to order some of these EXCELLENT games,
contact The Computer Dungeon at 708-547-7085 10am to 5:30pm CST M-F
or visit our webpage at: http://www.mcs.net/~isis/dungeon/dungeon.htm

Help support those that support us by purchasing Shareware titles and keep
new software coming.

JPEG loading uses a straight compile of an old library version, so
programs like St-Guide should be quicker, unless you have a Falcon with
the JPEGD DSP decoder installed.
I expect to move to the latest IJG JPEG library before the next MGIF
release. Then MGIF will also, finally, be able to load progressive JPEGs.

GIFs should load faster than with just about anything else, but on my
AB040 all GIFs I have load too fast to make accurate timing possible
(MGIF has built in timing, but other programs don't, unfortunately),
so it's been a while since I did much testing...

>I've always had trouble with the menu-item "Config/save" however, soon as I
>try that it gives me the fsel, then I select MGIF.OPT, hit return, it comes
>back with the fsel and on the next OK it hangs (both under MagiC and TOS).

Try reading the manual. ;-)

That menu item does not save the current configuration into an MGIF.OPT
file, but rather stores the contents of an MGIF.OPT file into the MGIF
executable itself. The second time the file selector pops up you're
supposed to give it the name of the program file to patch.

You can use this to, for example, make a special MGIF version that always
runs slideshows or one that simply loads its configuration files from
another place.

Naturally, MGIF still shouldn't crash if given a bad file.
I'll look into that.

>thing. However, I managed to "set" the options manually in the OPT file.

Some things can only be set in there and there is currently no way to
automatically create one.

>Nice piece of software, Johan!!!

Thanks. :-)

As always, I'm interested in ideas for new features, bug reports etc.
It's been a while now, but I intend to work on MGIF a bit this summer.

From: dipching@ping.be
Message-ID: <3580338e474462@ping.be>
Source record: 99213

Is there anyone here capable of testing a CaTTamaran card ?
I have bought one at the Atari messe at Neuss two years ago and never was able to make it work ...
At first time I remarked there was a missing IC on the board (removed from the first user ? something incredible !!!)
I succeede to find a replacement CMS component and soldered it on the board, but nothing changed in the card behaviour with my TT ... black screen at boot ...

I would like to know if someone here shoud be able to test/repair this little accelerator board.

Thanks for any email inquiry.

Yours

There are other problem programs -- with the budgeting program HOMEACCT coming
to mind. Most programs have no problem, however.

Maybe we could compile a list of problem programs and keep it at some web site, so people will know what software they need to update. E.g. if HOMEACCT doesn't work, maybe people would want to migrate to PHEM, or something else.

: : What's your hard disk driver? As far as I know for large partitions and
: : the MinixFS either CBHD, HuSHI or HDDRIVER are required.

I gave it a try with CBHD, and bingo... you where right again.
but now i have a related question: can you get small sectorsizes with large
partitions? (small is 512 or 1024) (with sectorsizes i refer here to the
logical sector size, the physical is always 512 if i am correct)

minixfs works with 1K sectors, and when your logical sector size is say 8K,
it will simple mask of the other 7K. this gives a huge overhead. al least,
this is how i interpreted docs :-].

When they were first made there was a couple of problems with noise but
since you will be getting a new one there should be no problem.

If you do, there is a pot inside.... and fiddle with it.

To record 8 channels at once use either Steinberg's ADAT recorder which
acts like a simple dump utility or use SoundPools Audio Tracker.

With CAF 2.06 you may have to recheck the sample rates every now & then.

Regards,

Rich

<snip>

Actually, James Fillary Haslam has just mailed me a copy of a small freeware Auto folder program by Simon Coward which solves most of the problems: it just adds 20 years to the date after the clock cartridge's Auto program has set the date. So you just set the cartridge to 1980 for the year 2000. I'll try to upload it to a couple of FTP sites over the weekend.

Javascript!=java

As far as Java is concerned, the kaffe Java Virtual Machine works on
my Falcon under NetBSD. It should be possible to port it to TOS/MiNT/
whatever, but it would be a lot of work (especially the graphical bit).
I also suspect it would be rather slow (it's slow under NetBSD, anyway).

Great project though for someone who has the time. :)

Dennis,

You might try a program called Web Page Creator. It is on the web. I use this alot and it seems to work fine using CAB 2.5 It is really not that all hard to write the code in a word processor either. That is if you know the code at all. There are several good tutorials on the web about HTML. If you need help doing something feel free to drop me email and I will help you out if I can.

Hi fellow Atarian....

PH Player v4.5 is ready for downloading at

http://probehouse.home.ml.org
http://www.geocities.com/SiliconValley/6880/phsw.html

New in this version:
* Plays MIDI files 25% faster than v4.4 (released last month)
* Bug fix for AIF sample.

What is PH PLAYER?
A DMA sample player for STE/TT/Falcon.
Plays MIDI, MS WAV, IMA WAV, AVR, AIFF, AU, SND, VOC & IFF samples.
Common playback speed supported.
and it's still FREE !!!!!!!!!!!!!!

Look out for more features in next release!

>meg scsi drive?

Hmm .. do you have the 3160 already or have you not yet bought it?
I'll tell you why ...

I had months of dreadful experiences with one of these and it
eventually ended up in bits on my desk after I got more and more
frustrated!

Looking back on it I believe the device was U/S when I first bought it
second hand, as a 'pull' from a PS2. Most likely it was not able to
read its microprogram from the disc so I was trying to run a HD which
only knew 3 or 4 basic commands.

The important thing is that any device you attach to the host adapter
in the SH204 must be able to have Parity disabled. From what I
remember the 3160 had no jumper for this but it was claimed to be
possible to do it by software. If you used a better host adapter there
is no reason why the device should not work as it is although I would
not touch one with a bargepole after my bad experiences!!

Does Seagate ST 31200N SCSI (?) work as internal or external disk on TT ?
If yes:

- What version of HDX (or other utility) do I need to partition it ?

- What driver should I use ?

- The disk has 3 sets of straps:
first set is composed of 3 straps named 0 1 2 (is it for SCSI address ?)

second set has 7 straps without names with third strap set.

third set is composed of 8 straps named SS DS ME WP PE TE TP TP
with PE and first TP set.

What are the rigth settings for these 3 sets of straps ?

Thank's for your reply.

Any thoughts on why my Falcon has trouble dialing when I set the
serial port speed to 57600 BPS? It works fine at anythin slower,
like 38400 BPS. But has a difficult time dialing when it's at 57600.
I've trid HSMODEM and FAST-SERIAL, both with the same results.
This happens with STiNG's dialer, and (any) term program I try.
I don't remember always having this problem, and even now, I
can get it to connect at 57600 maybe 1 out of 10 tries. I'm using
a Supra 28.8 modem. Do you think it's some setting in the modem,
or is my Falcon's serial port just flakey?

There is a zipfile around that describes how to connect a DS1216 chip to the ST, and includes software (and source I think) to address that chip. Maybe it's directly compatible with the ForgetMeClock. If not, you may still be able to have a look at the software to see how it works.
http://www.megacom.net/~q-funk/download.htm

Check out also www.dalsemi.com for datasheets on the chips.

I'm considering selling my TT with the following specs:

- Eickmann Bigtower
- Crazy Dots 15 bits graphics card (up to 32000 colors)
- 4MB ST-RAM, 68MB TT-RAM
- 425 MB HD
- 6.7X Toshiba cd-rom
- 88MB Syquest removeable
- SLM 605 laser printer w/ extra drum
- Plenty of software, manuals, bits & pieces

Excellent condition.
This is probably most interesting for scandinavian people as I live in Norway, but I will also consider offers from other europeans.
I'll be at NAS/Gothenborg on saturday 14. if anyone wants further info.

678. MagiC Tips

Newsgroup: comp.sys.atari.st
Date: 1998-06-12 00:00:00 UTC
From: Neil Roughley <roughley@HORMEL.unix.dsoe.com>
Message-ID: <FN_3580ef34_roughley@news.dsoe.com>
Source record: 99154

I've finally purchased MagiC 5.11, which should be in my hands in about a week. In the meantime I'd like to get ready for an 'install' on a TT: What utilities and add-ons specific to MagiC are recommended, what do they do, and where can they be found? How about configuration tips for a first-time MagiC user?

Any information that will get me up and running with the 'right setup' would be appreciated, especially things not covered in the manual. I want to 'plug-and-play' knowing I've done a little homework.

Thanks in advance -- I'll absorb any responses.

679. Backup tools such TURTLE, VAULT

Newsgroup: comp.sys.atari.st
Date: 1998-06-12 00:00:00 UTC
From: "david.guillen" <david.guillen@skwbio.com>
Message-ID: <01bd95f5$96f337d0$9dc969c1@mtf7inn201>
Source record: 99155

Hi in there,

A couple of week ago, I've dropped a mail regarding 'backup tool' for an Atari 1040 STE / SCSI HD. I was searching for a tool to copy the whole hard disk, or some parts to another media (tape, second harddisk, floppies ...). I have received an answer : turtle.prg and vault.prg, but I could not get these procs on the net, does somebody knows where to get it ??.

Thanks,

david.guillen@skwbio.com

If you email me directly, please include your email address in the mail (my client is not able to reply, or to show me the address).

Ahh, what a nice system, Petter. Is there any chance that seeing the Milan at NAS will sway you from changing platforms (if that's your intention)? I ask this because you're the only other Cranach Studio user I know ;-).

681. TAF Meeting June 17th - Anodyne/ExtenDOS Gold demo

Newsgroup: comp.sys.atari.st
Date: 1998-06-12 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <35811fd7.0@diana.idirect.com>
Source record: 99157

Agenda for the Wednesday, June 17, 1998, Toronto Atari Federation meeting:

Before TAF is off for our summer hiatus, we want it to go off with a BANG! And what better way than with a club exclusive!

Wednesday, June 17th, is when we host Roger Burrows of Anodyne Software, the man responsible for developing the first practical driver for utilizing CD-ROM drives for Atari Computers, ExtenDOS. And at this meeting, Roger will be unveiling two of his new products:

ExtenDOS Gold, the logical upgrade to ExtenDOS and ExtenDOS Pro which supports more drives than before as well as adds some new features, and CD-Writer, a practical and low-cost application for burning your own audio CD's using a CD-ROM read/write drive. Roger will also be offering upgrades for existing ExtenDOS users at the meeting.

As anyone can tell you, having a CD-ROM unit attached to your Atari adds an added dimension of having lots of media, text, and software archives with miminal storage space required. If you haven't yet hooked up a CD-ROM unit to your computer, or have ever been curious on what a CD-ROM can do for you, come to this meeting.

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the Rose Room of the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. (next to Mel Lastman Square) Parking garage inside the complex, enter off Parkhome Ave. next to Novotel Hotel. Those using public transit can take the TTC Yonge line to North York City Centre Station. Meetings start at 7:30 PM. $2.00 admission for non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. Membership in TAF IS Atari support!

682. TAF MonSTEr Flea Market July 11th

Newsgroup: comp.sys.atari.st
Date: 1998-06-12 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3581205c.0@diana.idirect.com>
Source record: 99158

SATURDAY, JULY 11TH, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 1:00 PM and will remain open until 5:00 PM.

This may be your 'last chance' to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

Not only is this an opportunity to buy or sell hardware and software for TAF members and other Atarians, this will also be an event whereby you can learn what you can still do with an Atari, including the Internet, Desktop Publishing, Scanning OCR, MIDI, and much, much, more! There is a confirmed Internet Demo (using the suite of available Internet prgs. running under STiNG), Howard Carson of MGI mentioned that he would be showing Calamus SL-98, and Martin Nueland will do a MIDI demo.

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

We are anticipating a good turnout and hoping to have some dealers at this event and thus TAF has booked a larger hall to accomadate everyone. To help defray some of TAF's costs of the event, the following will apply:

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admision is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is included. Admission for TAF members is, of course, Free.

The Flea Market will run from 1:00 PM to 5:00 PM, with setup commencing for sellors after 12:00 PM, noon, and teardown after 5:00 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Gold Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge.

Parking garage inside the complex - enter next to the Novotel Hotel on Parkhome Ave. Those comming by public transport can take the TTC's Yonge Subway, North to the North York City Centre Station, then walk through the tunnel into the concourse, down to the food court, turn left and find the Memorial Hall on your right.

Saturday, July 11, 1998, 1pm - 5pm for the TAF "Flea Market. To contact TAF on booking a table or tables:

From: thopman@uoguelph.ca
Message-ID: <6lr9i8rci2@testinfo.uoguelph.ca>
Source record: 99161

: I gave it a try with CBHD, and bingo... you where right again.
: but now i have a related question: can you get small sectorsizes with large
: partitions? (small is 512 or 1024) (with sectorsizes i refer here to the
: logical sector size, the physical is always 512 if i am correct)

: minixfs works with 1K sectors, and when your logical sector size is say 8K,
: it will simple mask of the other 7K. this gives a huge overhead. al least,
: this is how i interpreted docs :-].

Logical sectors are a workaround needed by the FAT filesystem (used by DOS and TOS) in order to handle large partitions. FAT16 can handle only ~65000 sectors, so you need large logical sectors once you start going above 32 meg partitions. Hence the hype over FAT32 in Win95 OSR2, which will handle 2^32 sectors -- no more need for 32K logical sectors.

MinixFS, on the other hand, is based on the UNIX filesystem, which uses a different and much more efficient structure -- its faster and doesn't require the use of logical sectors (blocks are actually 512 bytes, IIRC), so there's much less wasted space.

Following on from WAG sadly losing the use of the firestation at Whitchurch (an amicable decision btw) we are hoping to use a venue at Alton. However, in order to use this, we have to have insurance to cover our gear, etc.

Are the current crop of Atari clubs (CCC, STAG, SHAG etc) covered by a particular insurance or do we have to organise it for ourselves ?

I could always speak to my own insurance company relating to this if a current policy is not in force right at this moment in time.

Harry Sideras - if you are listening here - do u know what the current state of play is ?

Cheers,

Richard (Secretary - WAG)

Thanks for the replies, everyone. So I can safely assume that if I
re-partition my hard drive to include a 64 meg (or less) G:\ partition
that the KEMD R2 kit should work fine...right?

PS Yep, I know I need to change to HDDriver... ;-)

>Does Seagate ST 31200N SCSI (?) work as internal or external disk on TT ?

I'm using one in my MegaSte internally. I use CBHD as the driver, and
I used the ICD software to partition it.

>- The disk has 3 sets of straps:
> first set is composed of 3 straps named 0 1 2 (is it for SCSI address ?)
>
> second set has 7 straps without names with third strap set.
>
> third set is composed of 8 straps named SS DS ME WP PE TE TP TP
> with PE and first TP set.

According to my docs, there are jumpers for J2 (8 jumpers), J5 (3
jumpers for SCSI ID), and J6 (6 jumpers for SCSI ID and remote LED).

J2 - from back to front of drive:

1 terminator power
2 terminator power
3 enable t-res
4 parity enable
5 write protect
6 motor start
7 start delay
8 reserved

J5 - from front to back

1 ID 1
2 ID 2
3 ID 4

J6 - from left to right

1 ID 1
2 ID 2
3 ID 4
4 spindle sync
5 remote LED
6 reserved

Use J5 OR J6 for ID - not both.

No I don't. Annoying isn't it? That's one good thing about Windows I suppose, you can always stop a stuck program.

Two possible solutions:

1) Sometimes continually hitting Escape will work.

2) I believe in a multi-tasking environment it's possible to interrupt the Connecting to Host sequence. However, I'm only single so I don't know.

blimey ... what version of windows have you got! ;)

I don't think CAB is stuck as such more like that's were the computer
has bombed - and if its bombed then a reboot is the only way :(

Its a bug I remember from CAB1.5 altho I havent seen it in ages with
CAB2.5 ... CAB 2.6 is out soon.

Hi Neil!

>I've finally purchased MagiC 5.11
Poor you, MagiC 6 has just been released here in Germany >:-)

>What utilities and add-ons specific to MagiC are
>recommended, what do they do, and where can they be found? How about
>configuration tips for a first-time MagiC user?
You should get the following programs:
-Appline (like the Win95 taskbar: terminate / activate /freeze /unfreeze
programs)
-Start Me up (Like the Win95 "Start"-button)
I think these two are on the MagiC disks.
You can get the following two programs on my website:
-MagiC!Conf (to configure MagiC /MAGX.INF and handle several setups and
combinations of programs, Shared Libs etc.)
-MagiC Power Toys (some special stuff :-)
-Zcontrol (an XCONTROL clone, but much better with several CPXs in windows;
better than COPS (the rival :-)!!!)
-Bubble (a Help daemon that can display help bubbles e.g. for a button or
something via right mouse click)

>Any information that will get me up and running with the 'right
>setup' would be appreciated, especially things not covered in the
>manual. I want to 'plug-and-play' knowing I've done a little homework.
Plug&Play is not possible with an Atari (but even less with Windows :-).
Installing the o.m. things is easy: copy BUBBLE, APPLINE and STARTMEUP into
c:\gemsys\magic\start, copy MagiC!Conf anywhere else and make some settings
for that in the Power Toys and off you go. How to switch tasks and stuff is
explained in the manual. The difference in handling between MagiC and TOS
isn't THAT big.

> has bombed - and if its bombed then a reboot is the only way :(

Theorising here - that could be why a multitasking environment may
help because one process theoretically shouldn't affect the whole
machine.

No, it isn't crashing. We discussed this some time ago, and it is still my pet peeve about STiNG. What's happening is STiNG is waiting for the DNS to return some information over the internet, and in the meantime you just have to wait. STiNG hogs the whole system while this is happening and doens't even bother itself to read for any key presses, so there is no way to interupt the process by e.g. pressing your escape key.

And it doesn't even matter if you have a multitasking system. STiNG still blocks everything just so it can be sure no other network activity occurs until it gets an answer to its DNS query. As if this is so important you couldn't at least play a bit of solitaire in the mean time!!

I'm sorry if I sound a bit steamed about this, I really respect the work Peter R. has put into STiNG -- in most ways it is a very good piece of code -- but this is a stupid bottlenec and I have a flaky ISP and so get burned by this problem all the time and have to wait for the DNS timeout (about 90 seconds) before I can do anything. Usually I just reboot, I've found I can reboot and reconnect to my server in just under the DNS timeout, plus it gives me the feeling I am doing something and making progress. Another partial solution would be to be able to set the DNS timeout to something more reasonable, like 30 seconds (who knows, this may be possible, lots of configuration options I don't know all about in the configuration files).

My understanding is this is not a problem under MiNT Net, by the way. So there is a solution, if you don't mind ditching STiNG and installing MiNT Net instead.

and just to follow on John's:

For anyone who uses the accounts program Personal Finance Manager it has no problem with Y2K whether set from the external clock cartridge or manually. In fact it will pick up from the external clock cartridge (which James has pointed out isn't compliant without the patch) when it goes to 1 "0" not 2 "0"s, set the date correctly and the entries follow on in the correct sequence.

I tested it in several ways including giving it fictitious Standing Orders over 2 years and it was spot on every time.

r> How about configuration tips for a first-time MagiC user?

MagiC is extremely easy to install. I was up and running within 10 minutes and I didn't really know a thing about it.

The best advice is to completely clear your AUTO folder and ACCs, so that it will be installing on a clean system. Then start adding things one at a time, to make sure they'll work under MagiC (most, except for TOS patches, of course, work just fine).

Another good bit of advice is that you comment out or remove the #_TSL line in your MAGX.INF and turn on preemptive multitasking from the CPX. Otherwise, preemptive multitasking may make some of your auto programs choke.

Hi Ronald, on 03 Jun 98 you wrote: ...respect, brethren
t>
t> So what does Wdialog do, and when do you need it? I've got it in my
t> auto folder as well... Thanks! ;-)

Paraphrasing from the docs:

WDialog is a complete library of functions that can be incorporated into any TOS version. It provides windowed dialogs, popups, checkboxes, listboxes, radio buttons etc. Using it means you don't have to rely on the programmer coding his own versions, which may be incomplete or failing in functionality. Using a system library also means that program sizes can be reduced, because the programmer doesn't have to assume the user only has the functionality of the lowest TOS version and build from there.

Features of this extension are:

Compact, resident extension makes use of frequently needed routines: window dialogs, listboxes, font selector, print dialog.

High flexibility in the routines; i.e. no static limitations in the number of dialogs or simultaneously open font selectors; list boxes, that can manage more than just text-objects, multiple selection, auto-scrolling, etc.

Features and extensions of the OS will be used (3D effects, Clipboard in edit fields, ...).

Extended object types (Gruppenrahmen, radio buttons, etc.) assumed to be available, so that the RSC-File remains compact.

In older OS-versions missing object types will automatically be generated through a short routine (-ADAPTRSC.C).

Design of the program interface should to the "Personality" of the OS pass (no "Dino-Tuning" with 3D-effects under TOS 1.0).

The result of this is WDIALOG: A System extension, that makes available MagiC compatible AES-extensions.

The only missing element in Magic that is added by WDialog is the addition of the print dialogs, which are used in programs like Texel and CAB.

HTH

<crazyhoss@hotmail.com> wrote:

>Any info on Year 2000 compliance/non-compliance out there? We're still
>using a few STs as dumb terminals.

The ST clock starts counting from zero when you turn the machine on.
The current time and date is calculated by figuring this counter into
the date Jan 1 1980 (ie the ST thinks it is 01/01/1980 when booted).
This clock will not wrap around back to zero for another 30 years, so
no problems there. The software responsible for setting the actual
time/date only has to adjust the counter to the correct value -
providing this software takes all four digits of the year into account
there will be no problems.

This also applies if you have attached a clock module - the software
which reads the time/date from the module must take all four digits
into account. Additionally, the clock module itself must be capable of
representing time past the year 2000. This depends on the clock module
in use. Typically, clock modules are nothing more than counters
themselves with a battery attached to keep them alive when the ST is
turned off, so there's every chance it'll carry on working ok. It is
more likely for the software to fail. You can check this by setting
your clock module time to 23:55 31/12/1999. Wait 6 minutes and boot
the machine, praying you see 00:01 01/01/2000 as the date.

As for any other software you run, it again depends on how it stores
the time internally. If it uses all four digits you'll be ok - same as
above.

There's two ways a folder sorting prog could re-arrange the order of items within a folder. It can either move them all out then move them back in again one at a time like we would manually, or it could perform a low level access to the directory clusters themselves and move the entries that way.

With the first method I can see no reason why it would fail, unless perhaps long filenames are being used. Therefore the second method seems most likely. In this case it might be failing because (a) it cannot locate all the clusters for a given directory, or (b) because it has made assumptions about cluster size (most likely), or (c) the filing system isn't a Tos one.

The above assumes no errors in your hd structure of course.

Nope. I did attempt to disassemble it once and couldn't figure out what language it could be in. Mind you it was years ago. If I tried again now I might have more success.

The setting software for mine is pretty dire. It only works if you hit the power switch immediately after clicking on 'set' - otherwise the tsr which reads it will say the rtc contents are invalid and refuse to read it.

>Does anyone know where I can get these from in the U.K.?.
>Kevin Dermott was kind enough to take the case of his cartriges
>and inform me that the chip used is a Dallas DS1215,

The DS1215 is in mine also. If you've got a datasheet on it I'd be interested.

>Cheers, Stephen Moss.

Haven't thought about this until just now but ... there's a software hack possible if I'm not mistaken. Come the year 2000 you could revert to specifying 01/01/1980 in the setting program. Then you could place a hack tsr after the rtc reading tsr, which could add in the offset from 01/01/1980 to 01/01/2000 to the system clock. This assumes the chip is just a counter.

Yup, HDDriver here, so hopefully this will be ok. I think the issue of Bus
and Initiator arbitration was the one that I half-remembered. Now that
you've reminded me I've located a message from Uwe at the beginning of last
year that seems to settle the matter wrt Quantum Fireball drives.

Thanks for that.

>> A supplier I rang today didn't want to guarantee it, but I don't

> the returns policy is, wouldn't do any harm!

I'm becoming more confident. Unfortunately the returns policy of all
box-shifters is that I need to obtain compatibility information with the
manufacturer of the hardware, and of course I wouldn't expecthey'd be able to
say one way or another wrt a TT. The box-shifters don't accept returns of
drives that work just because of a hardware incompatibility that they're not
in control of... B^{<

>> Wrt the prices I quoted from Tech Direct for Quantum Fireball drives

Others will no doubt tell you about all the handy extras you can
install. That aside, install it on a clean boot partition with little
more than Nvdi still there. The only accessory I have today aside from
a control panel is Kobold. I'd even leave that out to start with -
it'll run as an app anyway of course. The reason?

Well, it's not because things will got wrong. It's rare that they do
but using a 'bare MagiC' for a few days lets you get used to how the
system is layed out without other things confusing the issue. You
might want to change some things, like the path to your replacement
desktop or where the auto/apps, accessories run from. There's no need
to reinstall to do this sort of thing. Most of it can be controlled
from the magx.inf file.

Then go through your apps seeing which work okay. Those that don't may
need to be set to run singletasking but my experience is it isn't too
long before you're out looking for replacements where they exist.

Once you've got, what you've got already, working then install the
utilities one at a time. When you're happy with the configuration I
suggest backing it all up - StZip will do admirably for instance. Now
you can go mad and install any old nonsense. ;-)

I eventually settled on a configuration where everything MagiC related
is on C: (including replacement desktops, system extentions etc) and
moved everything else off to another partition. This ensures that
should I accidentally wipe C: (which I have sometimes) the self
extracting zip backup will restore everything and all I need do is
reboot to bring the system back up.

One tiny thing annoyed me concerning the auto/apps folder. Everything
has to sit in it together and I like things separate. Maybe this has
been dealt with in the version you're getting but if it hasn't then I

wrote a small utility which allows you to place each auto-app into a subdirectory of auto/apps. You just have my utility in auto/apps which executes the others in parallel according to a datafile similar to 'autoexec.bat'. I lost the source sode for it but it has worked fine for yonks. Let me know if you want it - 'tis about 7k.

Oh, btw. autoexec.bat allows you to specify the order in which AUTO folder programs are executed. Use this in preference to utilities such as AutoSort etc.

Datzit! :-)

HD Driver sees the Toshiba?
>
>> > and Diamond Edge says,"Could not
>> >read physical sector 0" when I force it to partition IDE I0.

Scrap D/E for that kind of stuff. It partitions simular to ICD
utilites, and (flames coming) is generally incompatible with HD
Driver and SCSI Tool, ect. I'm not speaking technical, just from
experience. I have two Toshibas. Both were setup with SCSI Tool, and
even then, HD Driver dosen't recognize the fourth partition. D/E and
ICD just make matters worse. It's probably not what you want to hear
as SCSI Tool isn't the easiest software to get your hands on. Julian
should really think about extending support for this tool. Even though
it is German only, it is not all that hard to figure out.
The way to do this is to boot AHDI (6.06, not 6.061) from floppy
and get HDX 5.04 to partition it (3 parts). Then boot from floppy with HD
Driver and try to install the driver. If that fails, try to partiton
it with HD Driver (3 parts). Try to keep working from floppy, rebooting each
time you perform an operation. Remember, AHDI is not necessarly set
to see IDE 0 (which is the only ID you should use if you have only
one IDE drive). You will need AHDI config for that.
If you partition with HD Driver, use three partitions. Same with AHDI.
For some reason, 4 makes problems. Do all this with the EZ
disconnected for now.
Sounds like bull, but sometimes you have to do a rain dance to get
things to work. Try getting a 24X Cyber Drive to work on a Mac.
Jezzzz.
>>
>> 1) Whoever sold you the drive should have told you how it was partitioned/
>> formatted.
>
>I will find out, but I would like to reformat it anyway.

You have that right:).

I agree timing has a lot to do with the choice of software, likewise some cultural/economic factors, ie local calls are not free outside North America so online news and mail reading is very much a last resort.

In my case, I started out as a result of an article in ST Format, and there was only the original NOS package available. Oasis 1 was a revelation. STiK/CAB came later and because there was initially no mail/news software for STiK I stuck with Oasis/NOS for a long time. NEWSie isn't my favourite program for a number of reasons (most of which are matters of personal preference, I appreciate the amount of work the John Rojewski has put into it) and Oasis 2 was a huge disappointment so it took a while to progress through ditching NOS in favour of POPwatch/NEWwatch, then dropping Oasis 1 in favour of Okami. So add Gary Priest and Jos den Bekker to the list!

>Now there is a "WAR" going on to see who will control the Net. I'm curious,
>are you? I'm betting on us, "the few, the brave, and the hackers" <g>.
>The Net "WILL NOT" be a Micro$lop/Spammer domain...

Despite the gatesmeister's attempts at world domination, I'm currently with you on this, particularly as the next big thing may well be in the area of embedding net technology into smart devices for a variety of purposes (for example meter reading and other forms of data collection). Who in their right minds is going to try to shoehorn Windows/Explorer into a meter reading device? Or into next generation miniature PDAs which combine (for example) a pager, a diary and net connection to certain types of information services such as timetables etc for which full-blown web browsing isn't necessary, or feasible on a small screen device. BTW, I believe that one of the motives behind releasing the GEM sources into the public domain (or whatever open licence scheme it is they are using) was to promote it for use in embedded applications as it's so compact.

This kind of thing, plus non platform specific or multi-platform developments (Linux, BeOS, Java etc) are all hopeful signs, IMHO.

Cheers,
John

Thanks for that, you mentioned Techweb previously, I've seen an advert
(which is confirmed by their website) for 6.4gig drives at 129 quid +
VAT, is this the drive you were talking about previously that you said
was priced incorrectly? If that price is correct and you get it and it
doesn't work, I'll be glad to take it off your hands...

hi theo,
thanks for the reply,

:CF : minixfs works with 1K sectors, and when your logical sector size is say 8K,
:CF : it will simple mask of the other 7K. this gives a huge overhead. al least,

: Logical sectors are a workaround needed by the FAT filesystem (used by
: DOS and TOS) in order to handle large partitions. FAT16 can handle only

: MinixFS, on the other hand, is based on the UNIX filesystem, which uses a

but minixfs uses the TOS interface to the harddisk driver, and hence my
question remains. maybe i should refrase it in view of what you wrote like this:
allows a XHDI-compliant harddisk driver the individual access of physical
sectors even when the logical sector size is larger, as is the case for
large partitions?

hopefully you (or someone else) knows the anwser,
bye carel

Happens to me occasionally with CAB 2.5. My guess is that it's more to
do with the CAB/CAB.OVL interface. CAB is waiting for the OVL to do
something and the OVL is waiting for something from the other end of
the connection and neither is looking for keypresses at that
particular moment :-(

This is good advice, though when I first heard it I wondered why I'd
had no problems. When I checked, it was already set up like that (this
was with 5.03), so you might find it installs that way. Definitely
worth checking, though.

I've just started to update my web site and was hoping to expand my
Atari section (currently minimal). As a start, I've have a crack at a
Y2K page, though it's a little rudimentary at present and lacking any
navigation links.

If anyone has info on program compatibilty etc, please mail the
details to me at y2k(at)whalley.demon.co.uk (change the (at) to @).

Have a look at http://www.aixit.de/ (or is it www.aixit.com ?)
They sell a memory board for STf and STe that adds up to 8megs of memory
(requires TOS 2.06 or Magic).

I've got one in my MegaST and it works fine

I could see if I still have my copy of Syntex anywhere, if that's what
you really want - I see we are both in the UK.

But I think the shareware OCR (check the InterActive web page, or
CyberSTrider, can't remember which) is actually better.

Terry May (outrider@lvdi.net) wrote:
:
: Yes, it does, if your multitasking system is MagiC. I can easily drop CAB
: under MagiC when this problem occurs, and then restart it and go on my merry
: way.

There's the benefit of preemptive multitasking for you. Under geneva
things are a bit more frustrating. Even so, I still think the solution
has to occur at the STiNG and CAB.OVL levels; there is absolutely no
excuse for _any_ program taking over full control of the system and not at
least _itself_ check for the user's wish to "bail out." So, in this case,
if it is STiNG that is holding everything up, then STiNG has to keep an
eye on the Escape key, and if the user presses the Escape key STiNG should
abort whatever it is doing and allow the user to interface with the OS
again. That is only common courtesy. Don't want to use the Escape key
'cause it might conflict with something CAB is doing with the Escape key?
Fine, use the "Undo" key or another key and clearly document what the
bail out method is (consistently using the escape key would be good
though). I wish all games could be quite by pressing the Escape key too.

While I'm venting, why do I have to wait several second after each CAB.OVL
message before I can do anything? STiNG does this too. A waste of time.

> recommended, what do they do, and where can they be found? How about
> configuration tips for a first-time MagiC user?

Here's a couple of useful tips for you.

The first tip is to use a boot selector so you can choose between a TOS
or Magic setup. This doesn't need to be a perminant installation, but is
useful while you set up the auto-folder files. Even better is if the
selector will pick a default config after a time-out. That way, if you
install something that causes problems with Magic, you can disable it
before starting Magic, or drop back to TOS and remove it there.

The second tip is only of use if you'll be switching between TOS and Magic.
If you do, for whatever reason, create an 'autoexec.bat' file inside the
'auto' folder. In that list all the programs you want to start when using
Magic, giving the full pathnames. If you are using some that you don't want
to use under TOS, rename them as .APP, so TOS doesn't start them. Any
common programs can stay as .PRGs. This way only the progs you want under
each system are used, and it also makes it easier to check compatability.

I'm not sure this is a problem with STinG, as the only time I get this
problem is when trying to connect to a server that is down. It seems to be
more a problem with CAB.OVL as it only started when I installed v1.2904.
It's probably something to do with the code that removed some of the
timeouts that happened with v1.28. I'm not 100% on this, but is could be
the timeout in the .OVL has been increased significantly, or even removed
for the connection phase.

It doesn't block my system, but it could be that by me using Magic I don't
have the problems you're having. I'm quite able to carry on news fetching
and FTPing, all while CAB it 'locked up'. And if I get really impatient,
I kill it using the task manager and start it again, remembering not to
go back to that site for a while.

The latest version of Ghostscript, 3.5.3, I got from ftp lipshitz.ph.
utexas.edu/pub/atari/ghostscript/3.5.3/, as I dimly recall. I got an
adequate number of fonts using Lynx to http://godel.ph.utexas.edu/
Members/timg/gs/gs/html, or ftp.cs.wisc.edu. RTFM: if you do not
put it on drive F, it needs environment variables. Probably two
environment variables.

Somebody posted a complaint that Ghostscript did not read US government
tax forms, without mentioning the version number. I am almost too poor
to pay attention, so I get simple forms from the local library, and do
not know about this.

Sorry for the delay in replying. My TT, 128 Mb, needed a keyboard membrane
replacement. The trace for the control button did not stay fixed.

This seems to be a new problem with the latest CAB.OVL. If you abort a page, you have to wait several seconds to continue. I never had that problem with previous CAB.OVL versions. (OTOH, the new version is much more stable in other areas.)

Hi

Some years ago I got a demo copy of Syntex, an OCR program by Marvin AG distributed by the now defunct Signa Publishing Systems Ltd. Has any one got the full program with accelerator and manual? And would they like to sell it? Alternatively is Marvin AG still in existence? I tried to look them up on Yahoo! but did not find them.

And while I am here (so to speak) has anyone a copy of Wonderland they don't need? Specifically it is the fourth disk which seems to be deficient. I didn't help things by trying to repair it!

Many thanks.

767. HELP w/ Falcon... Bad DSP?

Newsgroup: comp.sys.atari.st
Date: 1998-06-14 00:00:00 UTC
From: kne104@psu.edu
Message-ID: <6lvf75$16mc@r02n01.cac.psu.edu>
Source record: 98994

My Falcon recently developed some problems which seem to be related to the DSP chip, but I'm not sure. When using Cubase sometimes (actually quite often) the sound becomes very distorted. This can be corrected by stopping playback and selecting "Reset Devices" one or two times. However, the problem will recur after starting and stopping playback two or three times. Also the game Running no longer works correctly. The program will boot the menu screen, but the sound is heavily distorted and the menu is non-responsive. Also the rotating cube in the corner seems to be very flickery, but it may have always been that way. Sometimes the menu crashes right away with four bombs and other times the animations continue forever. Since I am starting the computer in the same fashion each time this leads me to believe there is a hardware problem.

I opened up the case and visually inspected the motherboard. It looks pristine except where the previous owner performed a clock mod and took the inputs to line level.

Has anyone ever had this problem with a Falcon? I'd like to know what is wrong and how I can fix it. Suggestions? Solutions? If I need to make some measurements I have access to quite a bit of test equipment here at school. Also, if necessary I can do some soldering (actually I'm not too bad), but I am leary of doing a lot of surfuce mount work on the motherboard.

Thanks for your help,
Kort Eckman

Yes, but I bought MagiC 5.11 used (at a good price) as a stepping-stone to MagiC 6. Good fortune has made my 'timing' rather impeccable ;-).

I've been a longtime Geneva/NeoDesk user, so it's with some trepidation that I make the 'move' (this combination being very reliable for me). On the other hand, when I'm not running Geneva, I'm singletasking with the Ease 4 desktop, so MagiC will fit in well with that. Ultimately I want to modernize my desktops, too, with either Jinnee or Thing.

Thanks to everyone: Bengy, Christian, David, Guy, John, Terry, Petter. I've read and saved your posts, and downloaded about a dozen MagiC-related utilities.

Just got a CD ROM for my Atari STFM but my hard drive Link doesn't have a dual socket - just the old DMA. Has anyone in the UK got an old DMA to SCSI adaptor stuffed in a drawer somewhere?

Or any other ideas as to how I wire up a linking thing?

If you've got an adaptor, mail me direct rather than the newsgroup - I sometimes miss out on replies for some reason.

Hi Maciej,

The Mega does not have a SCSI interface - it is ACSI which is slightly
different.

To connect SCSI devices you need a 'host adapter' (ICD Link etc.)
which connects to the 'Hard Disc' port and converts it to standard
SCSI. You can then connect up to 7 or 8 standard SCSI devices.

You may find a 'shoe-box' kit second hand which will contain a power
supply, host adapter and a hard disc. This is probably the cheapest
way to start. Keep your eyes on the newsgroup for adverts.

hi folks,

a friend of mine is looking for a synthesizer to start composing
music. I have an atari 1040stfm up stairs collecting dust,
I know atari is great for music, and I have heard of cubase.
(may sound stupid, but I know nothing about all this, I used
my atari for entirely different purposes). Anyway, my question is:
can all synthesizers be connected to my atari?
what software is available for atari to aid in composing?
any sites that deal with this subject?

please reply by e-mail, as I do not visit this group often.
thank you!

Thanks to your rough marks I was able to located the NAS.

My family has had a good time in Gothenburg. A very nice town with lovely
shops and a very large amusement park. Lots of fun there, only I found
that the security rules were very stringent. My 4 year old boy was very
disappointed when he heard he was just 5 cm too short to be allowed at the
Kï¿½llerado attraction.
One thing I personaly found regrettable was the price of wine. 35 SEK
(2.77 UK ï¿½) for one glas house wine at a restaurant isn't that cheap. At
home I can buy almost two bottles (house wine, 0.75 cl.) for that price.

At the NAS I met quite some people I only knew from the Net. I think the
cashier will remember my son for a long time:-)

It was a pity I couldn't stay for the whole day.
Next time I surely will arrange my holydays so that I can visited the NAS
for a longer period and so be able to pick-up the seminaries.
I've a whole year now to lear some Swedish. Or maybe the cashier and
another guy of which I can't remember the name will be able to translated
the semiaries in Dutch by then.:-) I was surprised when I heard they
were studying Dutch.

CU next time
Martin

Source record: 99010

Being interested in Astronomy I have been checking out the Hubble Space Telescope Website http://marvel.stsci.edu which obviously has a lot of pictures of galaxies, star clusters, (currently one on Saturn storms) etc. mostly I assume in colour. There was one greyscale mentioned in Postscript format.

Is there anyway that I can see these on my 4meg 1040 STe other than in monochrome? I seem to remember some discussion recently on the subject but that seemed to be for Falcon, TT, Hades etc and not the humble hardworking STe that is happily doing an amazing job though somewhat gently as befitting its age.

I would appreciate any ideas. Thanks.

Trevor

784. Re: STiK &STinG Serial

If I remember right I read somewhere or saw it here in a post that STinG doesn't support TOS 1.0 All the ST's that I have have TOS 1.04 and my Mega STe's have 2.05 and 2.06 and STinG works great with them.

For whatever it is worth........

785. Re: WANTED: Atari STuff

Hi Steve,

I don't know if it helps, but it appears that Octalyser is no longer supported by the author. The last full version is available for download from Dead Hackers Society Scene page; according to the info there, the author has given permission for them to give away the 'hacked' version that also runs on the Falcon.
It does work on the Falcon although, after loading a mod, it gives an 'out of memory' message (on a 14 Mb machine ?), but the tune still plays fine. (The original will only run on my Falcon if I use the 'patch' from my 'Select 030' CD.)

Check out: http://wombat.ludvika.se/dhs/scene.html
for more.

ABT

Jim.

PS I did try to upload this information previously but it didn't appear in the NG - obviousy I've still got lots to learn !!

On ASH homepage, The URL is:

http://members.aol.com/ashinfo/index.html

It is on the download page.

cheers Joergen

Last time UTSI was about 867 indexed programs, now we have 916.

Thank you very much to everyone who keep me aware of all kinds of
url available programs.

IF YOU ARE AWARE OF ANY PROGRAM WHICH IS NOT YET LISTED IN THE LIST,
PLEASE LET ME KNOW IF WE CAN DOWNLOAD IT FROM A WEB PAGE ... NOT FROM
FTP ...

Jo Vandeweghe

789. CAB 2.7 demo

Newsgroup: comp.sys.atari.st
Date: 1998-06-14 00:00:00 UTC
From: outrider@lvdi.net
Message-ID: <3669_outrider@lvdi.net>
Source record: 99016

I downloaded and checked out the CAB 2.7 demo. It was nice of them to include English resource files. That should hopefully speed up the process of porting it to English.

Unfortunately, all docs are in German. Would one of our kind German friends please translate the update docs, so we know what's changed since v2.5?

From what I could tell, the demo, like the 2.0 demo, is fully functional, save for hotlist support, and the occasional alert to remind you that you're using a demo.

It doesn't seem to have changed a whole lot. It has a few new menu entries, which are nice, though not essential. I was hoping the problem with forms would be fixed, but I still get "Transaction failed" on even the simplest of forms. Is that a CAB.OVL problem?

I'd feel a lot better about it if I knew exactly what all has changed.

Nostrodamus phrophesised this from starlord@ to All...

Hi Dennis!

s> Organization: ptw.com
s>
s> I was sent the Demo of Penguin Homepage, it works on my TT/030, but
s> when I set it up on my Falcon030 (true color ST Med.Rez) I get a
s> message 'can't find rsc file'

Wierd - it works here (I use 256 colour 800*600).

My only guess is that it's looking for a resource file tailored for that screen size, try another res??

s> Also, it says where to get the 2.5pro verson from, but NO PRICE!

In the UK the FaST Club are the distributors email stclub@cix.co.uk (Paul Glover).

s> Does it cost THAT much???

14.95UKP plus post.

I found that there was at least 1 spelling mistake in the html that the Pro version demo produced "adress" rather than "address".

Speak to 'ya later!

bf> i am looking for the scooter pcb-layout program.
bf> as far as i know there should be a web-site. but i have no adress.
bf> can anybody help me???
```

I am selling the english version of Scooter-PCB officially in the UK for £50
+ £3.50 p&p. The programs are registered individually to the purchaser on
receipt of payment and name/address.
There is also a PD demo available (which does everything but save) for £1 to
cover p&p and disk costs. Contact me here or by snail mail at:
Peter West, 38 Woodfield Avenue, London W5 1PA. (0181-997 2218).
You can also find the demo at some PD libraries (but it'll cost you more!) or
on Cix, if you have access to it. It may also be on some BBSs.
There is a Scooter-support Maus group but it's in German and in Germany. This
does *not* supply the program! Only some updated component outlines (macros).

SUBJ: FYI: Atari, SCSI Zip and Link II

In a message of <08.06.98>, jhaslam@fortress.org.uk (90:102/0.99) writes:
j> Yes it does work. I have the Link II connected to a hd and the SCSI
j> Zip Drive, which work great. I'm currently using HD Driver (with
j> MagiC), but previously used ICD's driver software, and the Zip was
j> perfectly happy wi

Yes, I think the point is that the Zip is OK *with another drive* on
the chain to supply term power to the Link -- but it won't work on its
own unless you do a cludge to supply term power to the SCSI bus from
the mouse port or somewhere else! Also only the SCSI version can be
used with the Atari, not the parallel-port (Centronics) version, and
only Link 2 (not the original Link) supports parity. Not sure about the
later auto-switching dual version of the Zip -- this seems to have some
other problems, judging from reports elsewhere...

794. Mummies Playtime Completed and Released

Newsgroup: comp.sys.atari.st
Date: 1998-06-14 00:00:00 UTC
From: Deano@zetnet.co.uk
Message-ID: <358e2277.3592259@news.zetnet.co.uk>
Source record: 99021

I have finally released Mummies Playtime, and you can download it if you go to my site from my Atari Page. It needs two meg to work but I haven't been able to get it to work under Pacifist.

If you downloaded a test version then you will need to get rid of that and download ALL the zips. I originally said you would only need to download the main zip file after but I've had to alter a few things on the other disks....

Please let me know what you think.

Hopefully it is a CAB.OVL problem. There is no support for cookies either, not when you use the old OVL file anyway.

From what I understand, (I don`t read german to well) the cookie support and the autentification is the major changes in version 2.7. The rest is rather cosmetic,- oh, btw.- the d&d from the Hotlist to either the Trashbin or toanother program, depending on what you want.

cheers Joergen

The Zip+ works fine, at least with my TT. Someone else reported that IOMEGA has a notice on their Web Page regarding using the Zip+ in a SCSI chain. The problem seems to be data loss although it is intermittent. We have had a Zip+ hooked up in a SCSI chain at work for some time with no problems - and it is the first unit in the chain.

The parallel-port version can be used - but you need an adapter and special driver. I beleive Woller Systems is the supplier.

Steve Hammond

801. For Sale - North America (updated)

Newsgroup: comp.sys.atari.st
Date: 1998-06-14 00:00:00 UTC
From: outrider@lvdi.net
Message-ID: <3679_outrider@lvdi.net>
Source record: 99028

Here is a list of what I have left available, for sale in North America:

HARDWARE:

Monitor Master $10
NEC CDR-25BJ 1x external CD-ROM drive
(includes All Things Falcon/GEMini Atari/
plus two adult CDs) $30
US Robotics Dual Standard 14.4k modem $15

I also have many cables, so if you're looking for a cable, ask and
I'll see what I can come up with.

SOFTWARE:

CodeHead package (CodeKeys/HotWire/
LookIt&PopIt/MultiDesk Deluxe/
Utilities/Warp 9 w/Extend-O-Pak) .. $20
Imagecopy 4 ..... $20
Kobold 2.5 ..... $15
STalker 3 ..... $10
STraight FAX! 2.2 ..... $15

Also, choose one each of the following for FREE, for every piece of
software you buy:

DC Utilities 2.0c
Diamond Edge 1.1
Hard Drive Turbo Kit/Turbo ST screen accelerator
Spectrum 512
Tempus II text editor
TV Sports Football
Ultimate Virus Killer 6.0

All software is on original disks and comes with original manual.

Prices do not include shipping, though prices and shipping are
negotiable on multiple items.

>for the owner

Just for the record and it can only be a generalisation because there are so many possible variables -

In theory you need a Public Liability policy to cover damage to leased or rented property or injury to persons thereon (including member to member risk) caused by negligence of the club members. Unfortunately these policies usually have a minimum premium of £50.00 for which you get an Indemnity limit of £500,000 upwards.

It depends too on any agreement/contract that you have when renting/leasing/hiring a room or rooms. A contract for hire often contains some clause stipulating what insurance cover is required. In todays atitude towards litigation a disclaimer may not be worth the paper it is written on.

To take a couple of extreme cases of a person acting as a member of the club:

Hardware set up and cables left in such a position that someone, not necessarily a club member trips, and is injured in the fall.

A serious fire causing damage to the premises brought about by negligence.

Trevor

Message-ID: <6m1d4v$9m6$1@kira.peak.org>
Source record: 99033

I've been away from the Atari scene for a while. Recently I re-subscribed to this newsgroup, and there's a a lot of discussion about CAB, STing, etc...

Is there a guide or FAQ that details what each does and what each requires? The pros and cons of each? I'm mostly interested in a graphical web browser and a slip/ppp program. News and mail aren't as important right now.

Thanks for any advice. I only read news on weekends, so any follow-up will likely have expired by the next time I check in, so please reply by mail also to thaanuj@peak.org.

Thanks.

What's strange about that ? Sven and Wilfried are the NVDI programmers, they
did WDIALOG, but are not involved in MagiC.

>
> Not as braindead as readers that cannot cope with them.

It's usually not the reader itself but the editor when replying. For quoting,
the number of characters per line needs to be fixed anyway, as each certain
number of characters a quoting character needs to be inserted. After that is
done, the only benefit of long lines (wrapable to the readers window width)
is lost. As the long lines benefit will therefore only hold for original
text, while all quotings are fixed line length anyway, I think it's stupid
to use long lines in the first place. It does not lead to an improved
display of the text, but a more warped one.

You do not know what's going on there, this text is mainly crap.

When the STinG resolve module waits for an IP address reply on a DNS query,
it calls _appl_yield() which allows for both cooperative and preemptive
multitasking. Nothing is blocked except from the thread (or process on
systems that do not know threads) that has called the resolver. Especially
not the whole system is hogged. That thread is of course blocked because
it cannot go on with the IP address.

> and doens't even bother itself to read for any key presses, so there is no

Why should STinG read any key presses ?

> way to interupt the process by e.g. pressing your escape key.
> And it doesn't even matter if you have a multitasking system. STiNG still
> blocks everything just so it can be sure no other network activity occurs

This is nonsense. Under MagiC a resolve action never blocks other programs,
and appropriately written software can even avoid being blocked itself while
it does a resolve action. Take the last version of my TelStar as an example,
you can open another Telnet session, while the first session is still looking
for the IP address from a DNS query.

> until it gets an answer to its DNS query. As if this is so important you
> couldn't at least play a bit of solitaire in the mean time!!

There is nothing stopping you from doing this.

> I'm sorry if I sound a bit steamed about this, I really respect the work
> Peter R. has put into STiNG -- in most ways it is a very good piece of
> code -- but this is a stupid bottlenec

It must be due to some strange configuration at your side. There is no such restriction in the code, and experience shows that I'm right. Which multi-tasking system do you use ?

> and I have a flaky ISP and so get
> burned by this problem all the time and have to wait for the DNS timeout
> (about 90 seconds) before I can do anything.

A DNS that regularly takes more than 3 seconds to reply is crap. Are you sure you use the one recommended by your ISP ? If so, complain, complain and complain again. If nothing helps, change ISP.

Networking relies so heavily on the DNS that the servers must respond in milliseconds, and usually they do.

> Usually I just reboot, I've
> found I can reboot and reconnect to my server in just under the DNS
> timeout,

Untolerable situation. Although my ISP is slow sometimes too, I never had it that it took more than about two seconds to come up with the reply on a DNS query.

========
Aha. Geneva is the only AES that exists for Atari that does not implement
the _appl_yield() system call. I understand Dan Wilga wants to implement
it too in the next version, I dunno if it's out already ?

> there is absolutely no
> excuse for _any_ program taking over full control of the system and not at
> least _itself_ check for the user's wish to "bail out."

Good, in that case each piece of software will need to implement it's own
resolver. Have you done that in MyMail ?

The resolver is merely a system call, that will take a while to execute (It's
the only STinG call with that "feature"). The only way for cooperative multi-
tasking to go on is to allow for task switches while the code proceeds. The
resolver code does that by calling _appl_yield(). This means, *even* on
singleTOS, accessories work while the mail application does a resolve. What
else do you want ? You cannot seriously ask for checking for pressed keys,
can you ?

Do not blame a shortcoming of Geneva to STinG or it's clients. That'd be
ridicolous.

> So, in this case,
> if it is STiNG that is holding everything up, then STiNG has to keep an
> eye on the Escape key,

Bullshit. First STinG doesn't do that in the first place, as explained above,
second, what has checking for keys to do with resolving IP addresses ? What
should an application do that wants to use the Escape key for something
different ?

> and if the user presses the Escape key STiNG should
> abort whatever it is doing

No.

> and allow the user to interface with the OS
> again. That is only common courtesy.

Common sense it is that requires to not bind arbitrarily keys to OS functions
that do not have anything to do with keys at all.

> Don't want to use the Escape key
> 'cause it might conflict with something CAB is doing with the Escape key?
> Fine, use the "Undo" key or another key and clearly document what the

Fine, and what if the Undo key is used for something else ? (BTW. it is in
TelStar !)

> bail out method is (consistently using the escape key would be good
> though). I wish all games could be quite by pressing the Escape key too.
>
> While I'm venting, why do I have to wait several second after each CAB.OVL
> message before I can do anything? STiNG does this too.

Hardly. I'd bet you haven't really investigated if it's STinG or the OVL or
CAB. Or even Geneva ? Sure, it's easier just to blame any one of them.

Yeah, I gathered that.

One neat thing I noticed tonight was that it gives you the ability to save the background image. Before you had to go into the cache, find it, and copy it manually. The new method is obviously much easier and faster.

Another nice new feature is that when you open up a link in a new window, it immediately opens the new window, so you can see what's happening in the status bar. Before you had no idea anything was even happening unless you looked at the receive light on your modem.

Unfortunately, you still can't use Alt-B on your original window, once you close your additional window. You have to click on the left arrow to go backwards.

Well, I'm using two different ISPs and I get stuck on "Connecting to host" on both of them. It's not an everyday thing, but it happens quite a bit when I'm checking out new links and it finds one it doesn't like. I've also had it happen after I got to the link, but then tried to download something with the background downloader. Usually, the only way out is to terminate CAB or the background downloader through MagiC's application screen.

>> Not as braindead as readers that cannot cope with them.
PR>
PR> It's usually not the reader itself but the editor when replying.

Well, there's a very popular Atari reader that doesn't provide wrapping or a window gadget to let you even READ long lines.

PR> For quoting, the number of characters per line needs to be fixed
PR> anyway, as each certain number of characters a quoting character
PR> needs to be inserted. After that is done, the only benefit of
PR> long lines (wrapable to the readers window width) is lost.

That's not true at all. The FidoNet standard allows for unformatted paragraphs and any decent reader (such as LED) automatically wraps and reformats the lines as necessary both when reading and when quoting.

If the original poster doesn't want his text reformatted, it's simple enough to hardcode the lines (just press Return at the end of each line you don't want reformatted). The reader won't reformat those lines, because it only reformats when necessary.

PR> As the long lines benefit will therefore only hold for original
PR> text, while all quotings are fixed line length anyway, I think
PR> it's stupid to use long lines in the first place. It does not
PR> lead to an improved display of the text, but a more warped one.

I would agree that long hardcoded lines generally lead to messy displays, even on a good reader. However, unformatted paragraphs are another story. They allow your reader to wrap them to fit your screen instead of fitting some archaic standard.

But we've been down this road before. I understand the need for reasonable line lengths on Usenet (not because it's such a great idea, but because the current standard is so established). I just think that any decent reader should be able to cope with those line lengths that DON'T conform to the standard.

Dunno, but the SH204 does have a DMA to SCSI host adapter.
Some one I know once tried a replacement but it wouldn't work.
At the very least you do have a usable case and powersupply. Then all you'
need is a SCSI mechanism and a host adapter of some sort.
Later...

From: nameerf@flash.net
Message-ID: <6m3mapdr1@excalibur.flash.net>
Source record: 98893

Hello!

What scanners are currently supported for TOS machines? I've
only seen Microtek and Umax advertised, but these scanners that I've
seen in the stores are pretty expensive. Are there any other drivers
available? For a Mustek scanner? (I've seen one advertised in a local
office store for $50 (US)! Thanks!

I have a complete Mega ST4 system and a TON of software for sale. Sale is open to all. I would prefer to sell the whole package as one lot, but will consider offers for individual pieces of software or hardware.

Package Price: $425 (US)+freight, or best offer. Inquiries should be directed to

WFChris@aol.com

The package includes the following:
Hardware
1 Mega ST4 & Keyboard
2 Monitors; 1 SM124 momchrome & 1 SC1224 color
1 monitor switch box
1 mouse
1 joystick
1 MouseMaster switch box
1 ICD 44 mb Syquest drive
1 SF314 external floppy drive
1 Cannon BJ10e bubblejet printer
1 Supra Modem 2400 (ok, its not very fast, but it was good enough for GEnie)

Software
Applications
Calamus v 1.09.6 & 1.09N
Flash
Clean Up ST
Word Perfect
Degas Elite
Data Manager
Word Flair
various utility programs such as NeoDesk

Games
Maniac Mansion
Empire
Star Wars
Gauntlet
Warlock
ArcticFox
King of Chicago
Thunderbirds
SimCity
Ancient Art of War in the Skies
Steel Empire
ShadoWorlds

Balance of Power (1990 ed)
Rorke's Drift
Railroad Tycoon
Storm Master
Populus
Power Monger
War in Middle Earth
Defender of the Crown
Lemmings
Hitchhiker's Guide to the Galaxy
F-16 Combat Pilot
Star Glider
Jeanne d'Arc (in German)
The Secret of Monkey Island
Autoduel
Hard Drivin'
Civilization
Realms
Their Finest Hour: The Battle of Britain
Frontier: Elite 2
Thrid Riech
Pirates!
Chronoquest

835. Timeworks Install problems...

Newsgroup: comp.sys.atari.st
Date: 1998-06-15 00:00:00 UTC
From: jaubrey@jaubrey.demon.co.uk
Message-ID: <897936088_OASIS_@jaubrey.demon.co.uk>
Source record: 98896

I've been trying to install Timeworks 2.0 again(from St World cover disk 4), because I have a new printer(JP190 Olivetti inkjet), I selected HP inkjet 300dpi, because this produced the best test page and went through the diskswapping(YAWN) process. When install was complete I ran Fontwidth.app and no printer was selectable, I tryed reinstalling 3 times useing 150 dpi, but the only one to install was epsonfx which is no use to me :(. Anyone got any ideas or a complete instalation I could use?

Many Thanks,

James

Yes,- Mustek and HP scanners are supported to. You can find demos of
two drivers, at Homa Systems homepage. They also sell the drivers.

http://www.magmacom.com/~nima/

I have seen a scanner driver called GTLook2.
I suppose it is for Epson GT Scanners?

From: dalessio@manatee.cig.mot.com
Message-ID: <dalessio.897935492@manatee>
Source record: 98898

I have some old PC2 (Degas compressed) pictures which I want to convert for viewing on the PC. Is there a pic converter which will convert the compressed med-res pics into GIFs, or any other PC-recognized format? C code or PC executable would be fine.

I have a program which handles the uncompressed PI2 format, but not the compressed PC2 format.

Thanks!

>right up.

Thanks. It is a bit sparse at the moment, so if anyone has any further
information on y2k issues either post it here or mail me at:

y2k(at)whalley.demon.co.uk

(NB change (at) to @ - this is an attempt to avoid yet more spam
landing in my mailboxes)

Likewise let me know if anything is inaccurate or if there are
workrounds etc which aren't covered. Also if any links are broken.

BTW, I uploaded the clock patch program to ftp.funet.fi and
ftp.lip6.fr last night: look for CLOCKPCH.ZIP. It's also available at
from my y2k page at the address above. I'll get the page tidied up a
bit and properly linked in to the rest of my site in terms of
navigation etc in the near future.

Cheers,
John

DEUCE 98
The Atari Users of North Texas (AUNT) Computer Exposition will be coming again to
Dallas this November in conjunction with the monthly DFW XChange Super Saturday
activities at the beautiful Dallas Infomart. Show date is planned for Saturday the
14th. As with the last three DEUCE shows, the actual show date will be finalized
120 days prior to the exposition. The exposition, along with the Super Saturday
activities, charge no admission fees and are open to the general public. The one day
exposition is planned to begin at 8:30 AM and run until 4:00 PM. A Friday evening
pre-show get together and a post show get together are also being planned.
November is still a great time to visit the Dallas Metroplex. The DFW XChange Super
Saturday activities are a monthly computer extravaganza where thousands of computer
enthusiasts get together, share their computer interests and enjoy some of the best
computer and high-tech electronic buys in Texas. This November will again be special
for us Atarians because so many of our finest developers and dealers will be partici-
pating in the activities.

The Dallas Infomart facility, a replica of the famous 1895 World Fair Crystal Palace,
is located in the heart of the Dallas commerce district at 1950 Stemmons Freeway
(Interstate 35E). The facility is leased by the DFW XChange each month to provide
a community service to all computer users in the Dallas-Ft Worth Metroplex area. The
Atari Users of North Texas is one of many participating user groups that help support
this community service by sharing our Atari computer interests, general computer
expertise and providing user assistance to our local Atarians and the interested
general public.

Vendors are being lined up. Systems for Tomorrow, chroMagic, Crawly Crypt Corp and Emmulators have already expressed their interest in participating in the show. Vendors interested in participating can contact David Acklam at (972) 242-9655 or via email at d.acklam@genie.com. You can also visit the AUNT internet home page at http://www.startext.net/homes/aunt.

re. mad Cab/Cab.ovl resolves.

I'm not entirely certain what causes it. It goes without saying
of course that I never experience it myself or else I would have put alot
more work into traking down the problem. I have tried a few different
ways of trying to eliminate it, but whenever it seems to help one person
out, it consequently get's worse for another user. The last few releases
of the OVL for STiK that I've made have been concentrating on reducing the
code size and eliminating as many bugs as possible. I had to take some
time off due to a cub scout thing, but now that summer is in swing I
actually have some time again. So there should be a new release some time
in the next few weeks and hopefully it will work better for everyone, not
just some.

>i have a 4mb ste (ex520) with tos 1.62 and an extra floppy

>yes get it from the upgrade shop uk 01625 503448
it's about the same price as a scsi host which it will work
alongside with,you don't need to format ide's ,hd driver,ahdi
6.06 and maby others will partition it,it supports 0&1 and
possibly two more with the latest hd driver,although i have not
got another two to test it with,it's connection is a laptop
type and three solder points, but with an adaptor you can use
a 3.5" and put these wherever you want.

i have fitted one of these and squeezed two 2.5" drives
inside an ste,one point tos 1.62 will NOT boot from an ide
you need to do it from floppy,tos 2.06 is fine

Message 162 Fri Dec 08, 1995

> Before I dig in to install it, I know there are some jumpers I
> have to change to get access to the 16 megs.

Here is the info I have:

** From: Tue Aug 02, 1994

If you have one of the 'older boards' which had only 3 jumpers:

set jumper dW3 to 1-2 (non burst, 2-3 is default)

If you have one of the 'newer boards' which have 6 jumpers:

set jumper W105 to 1-2 (non burst, 2-3 is default)
In both cases the jumper to change is the closest to the DRAM
controller
(the big chip).

** From: at 08:36 EDT

>>>JUMPER SETTINGS FOR ATARI TT RAM BOARD

With the board placed in the TT and looking at it from the front,
there
are two rows of jumpers. There are 5 on the bottom and 1 on top.
From this perspective each jumper can have 2 settings: Either on the
lower
two pins (D) or the upper two pins (U). (lower is closer to the
front of
the TT)

4 MEG SETTINGS
Top Row: U
Bottom Row: U,U,U,U,D

16 MEG SETTINGS
Top Row: D
Bottom Row: D,D,U,U,D

Category 28, Topic 13

Message 163 Fri Dec 08, 1995

I have a copy of the TT RAM settings for a rev C board and here they
are:

Type SIMM's W101 W102 W106
---------- ---- ---- ----
1Meg X 8 2-3 2-3 2-3
4Meg X 8 1-2 1-2 1-2

Starting RAM Address W103 W104
------------------- ---- ----
$0100 0000 2-3 2-3

Address Mode W105
------------ ----
Non-Burst 1-2
Burst 2-3 (Default)

I got 2.7 today, moved the files into the 2.0 folder and also the new
support filesfrom it's modl folder to the one in the 2.0 folder. I then
ran it withoutfiring up the modem and set all thepaths etc.

Then I fired up modem, used STinG to connect and ran cab 2.7, I loged
onto the recycler page, tried to logon with my username and password to
the section I want to see. Guess what? IT FAILED just like 2.0 always
did. And I had marked the cookie setting for always use.

Thanks for the tip, guys -- the Milan looks really sweet. My real
computer is an '060 Amiga, so I know how bloody fast these things can
be. I would like an '060 Hades but just can't afford one, so a fast
Milan might just do the trick.

BTW, how do you like your Hades machine? :>

Best;
Steve Duff Team *AMIGA*

852. WTB: Afterburner040 for Atari Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-06-15 00:00:00 UTC
From: burr@cyberhighway.net
Message-ID: <6m3psshks1@news.cyberhighway.net>
Source record: 98913

Hello Atari People!

I'm looking for Titan Design's Afterburner040 for the Falcon. I do live in the United States and I'm very interested. If you have one and would like to trade some $$$$ for it contact me directly by E-Mail: burr@cyberhighway.net and maybe we can make a deal. Will work with an international money order if necessary. Unit must accompany all docs and distribution diskettes that were included with it.

Later,
James B.
burr@cyberhighway.net

853. CABDEMO

Newsgroup: comp.sys.atari.st

Message-ID: <6m1pdq$8qm$1@supernews.com>
Source record: 99051

The 2.7 Demo does support "cookies" - but you will need to use STinG and CAB.OVL 1.2904 (Dan Ackerman). It does work well. The forms thing that Terry mentioned is off and on for me. I subscribed to Eric Hall's "Mymail" page and while I got a "transaction failed" flag from CAB - the message did go through as I got a reply from Eric's server regarding an upgrade to MyMail :). Other forms have not presented a problem. I think a lot of it may have to do with the server involved.

Steve

854. Cab crashes.....

Newsgroup: comp.sys.atari.st
Date: 1998-06-15 00:00:00 UTC
From: NOSPAMwplatt@bellsouth.net
Message-ID: <0M_g1.2892$3t5.3229539@news4.atl.bellsouth.net>
Source record: 99052

Hi, I'm new to this newsgroup; actually I have been following for a few months. Anyway, when I load TOS off of a disk, or use gemram CAB crashes. Does anyone know why and if this could be fixed. Also, CAB does run under Multitos. I really would like to get it up and runnoing with Multitos before I actually buy the product. I use the CAB 2 demo right now.

Thanxs in advance:')

B.P.

When I first started my involvement with User Groups I was told by Derryck Croker that the British Association of Computer Clubs ran some kind of an insurance service for machines st meetings or travelling to and from them. I never managed to get a response to BACC, but Derryck may still have this service running for the Cheshunt group.

Is it still going Derryck?

If you are using CAB 2.7, CAB.OVL (1.2904 by Dan Ackerman) and STinG you will have "cookie support". And you can still use the Recyler Web page (at least the one in LA) with CAB 2.0 (2.5) by just hitting the "Reload" icon within CAB when you want to go to a new page. This is after trying to get to the next page and you wind up on the one you started with. I know it works - I have done it for some time. And I know that the Demo version of 2.7 works in this regard also as it will load the next page correctly where 2.5 will not.

Other sites that now work correctly are Yahoo, AltaVista, my old friend the Citroen site in Canada that would not load under MagiC4.0 + a host of others. In fact I have been able to get to some problem sites with the 2.7 demo that have caused problems with Opera 3.21 and my PC (not to mention NetScape).

NOW - when is 2.7 going to be available in North America?

Steve

Well, you are right, the "NEWS" page was not really updated because
there were yet the older update ...

Now I have removed the old update and you can see which are the latest
added indexed programs (14 juni 1998) at this page:
http://ping4.ping.be/dipching-drulkhor/PRG-NEW.HTM

:
: Well, I'm using two different ISPs and I get stuck on "Connecting to host" on
: both of them. It's not an everyday thing, but it happens quite a bit when

Yeah, this is exactly my problem, only it isn't just certain URL's. Some days everything works fine, other days, after a while, it appears the DNS just stalls. The 90 seconds that I wait aren't for the DNS to finally respond, when it does it does so in milliseconds. The 90 seconds are me waiting because the DNS just isn't ever going to resolve and it takes something (STiNG, CAB.OVL, or whatever, I know not which) that long to finally give up (if I'm unlucky it will just give up on one file and go on and try to fetch the next before reading that I have clicked the "Stop" button in CAB, in which case I have 90 more seconds to wait).

Anyway, many many apologies for misattributing STiNG from hooging the entire system when the case was really STiNG was hoggig the entire system because Geneva doesn't suport the necessary feature of the AES that STiNG relies on to keep from hogging the whole system. You can see how I, as a non-prgrammer, could be confused as to where the fault lay. As an end-user I see that when something happens in the process of using STiNG things sometimes seize up. But I really must apologize to Peter R. who has implemented code that would resist this problem and save that energy for trying to get Geneva updated or switch to Magic.

Changing ISP's would probably also be a good idea. I think there is something flaky about their DNS (and I _am_ using the IP they suggested for DNS).

Really? I wasn't aware of that. How do they act as floppy drives then ?
I suppose it's one of those PC BIOS tricks that remaps it.

Cheers,
Nick

Since the ST can read pc-formatted 720k disks, another approach that should work (never tried it) would be to format a 720k disk on your pc, mount it in pacifist, and copy your files to it from there. A bit of a hassle, and it wouldn't work for disks that don't use a normal filesystem (many games). But it's a good approach for moving files between the emulator and 'the real thing' if you don't need to write a full disk image.

Any MIDI synth can do it. That means almost any decent keyboard, except
the REALLY cheap Casios and Yamahas.

> what software is available for atari to aid in composing?
> any sites that deal with this subject?

The problem is that the best music software for Atari is no longer
supported, although you can still find a few new and used copies around.
Look for either Cubase or Notator, whatever you can get your hands on.
Try it first, if you can. Sweet16 is a shareware sequencer that is still
supported. Do a web search for Sweet 16 and Roni software.

You don't mention what machine you are using, but CAB requires at least
1Mb. If you have a 1Mb machine, depending on the version, TOS is either
196K or 256K. If you load it into RAM (disk load or gemram), then you
won't have enough memory for CAB. Same goes for MultiTos.

Is it possible to activate STiNG without having XCONTROL installed ?
If I haven't, I get the message "STiNG not installed" if I try use the
dialer. I'm just wondering, everything works fine with XCONTROL, no
problems.

It's already been done, the Panther adapter has been available for
several years. It's ST only though... The latest version of the
Panther has two ISA-slots, so you can connect both a graphics-card and
a network-card. I believe Peter Rottengatter is working on a
NE2000-driver for STiNG.

> card. Just write generic VGA drivers, and let everyone else hack at
> specific chipsets...

A generic VGA-driver would be *very* slow, but as soon as Johan
Clockars' fVDI gets reaaly usable (I saw it at NAS this weekend, it
looked very promising) it shouldn't be too hard writing real drivers.

> And then, hooking up a GUS soundcard would be a neat hack... I suspect the
> DMA used by soundblaster cards would be a pain to implement though...

Erik Hall is working on a PnP-extension to TOS, which is already up
and running on his Hades. I *believe* that it supports DMA.

>

The one at http://www.megacom.net/~q-funk/download.htm definitely does
mention a DS1216E, not 1215. These are piggyback chips that go between
one of the ROM chips and the socket. I think the 1215 is a normal socket
chip.

Note that the E is the 28 pin piggyback chip, and the F is the 32 pin,
so if you have TOS 2.06 in an STE, you would need the F version. I
haven't tried it though.

The upgrade looks pretty simple, and more elegant IMO than using up the
cartridge port, however the problem is the availablitiy of the DS1216
chip. I inquired about getting one from Dallas, as they do sell small
quantities for prototyping and stuff, but it turned out to cost more in
shipping than for the chip itself. No local sources could get the part
for me.

Cheers,
Nick

I agree, that's something that's a bit annoying: You must activate STiNG
with the CPX, which takes up memory on small configurations. A good idea
IMO, would have been either to have an equivalent ACC, or to have the
ability to activate or deactivate it from the Dialer. Why not even link
it to the "enable/disable" button in the Dialer.

Peter, what do you think of this ?

Cheers,
Nick

Only STE models take SIMM memory, but adapters can be made or bought to
make other STs expandable.

It's all in the Quick FAQ.

The problem with this driver (and I think it's the reason why the development has more or less stoped) is that the ISA port on the Hades hasn't got real DMA so it's being faked which means that the driver takes 90% (well maybe not 90%, but enough to make you cry) of your CPU time on a 060 Hades. Not realy the idea with DMA transfers, is it? ;-)

Does the Milan support DMA on both the PCI and ISA?

You're right, with MiNTnet and the CAB.OVL for MiNTnet there are no
such problems. But this has nothing to STiNG or MiNTnet, but rather
the CAB.OVL for STiK/STiNG. There seems to be some sort of bug or
feature in either CAB or the CAB.OVL which causes a dead-lock from
time to time, and the only way to recover is to kill CAB.

The MiNTnet-OVL runs as a separate process (so it doesn't block CAB
while downloading), and if I kill CAB.OVL separately I get the problem
you describe (CAB hangs).

Hi there!

Is it possible to find a piece of software for the ATARI ST computer that can convert the mouse buttons so that a single click (rather than two) would be sufficient to open a file? Alteratively, can we write such a programme? This is to allow a disabled person who can not move her hands fast enough to access files.

Thank you in advance,

Asteras Amaliadas - Listarchos21

Try Emanuel Mï¿½cklin's Magic Mouse v1.07. Besides being a mouse accelerator,
it can turn a single right click into a left double-click through the use
of a small TSR and CPX.

Check your mailbox.

The mega STE is the same as the STE, up to 4 meg with simms. The
normal St's and normal megas can be upraded using simms but you need a
memory board like the marpet xtra ram board.

s> that I have clicked the "Stop" button in CAB, in which case I have
s> 90 more seconds to wait).

At least yours times out after 90 seconds. I've had my background downloader stuck for well over an hour before I finally just killed it. And I've had CAB stuck for several minutes before giving up and killing it (it's a lot easier to let the background downloader go on indefinitely than it is CAB).

Well, I DO have my SMTP address defined, and I get "Transaction failed" when
trying to vote in a simple online poll, among other things that have nothing
to do with sending mail. That is, unless you're saying that forms ALWAYS use
mail.

THE COMPUTER DUNGEON has updated our website as of June 16th.

Included is our 1st ever "MOVING SALE" where you can save 20% to 25%
off in-stock products (Shareware games, selected hardware, and magazines
not included).

Atari Computing Magazine Issue #9 now in stock!
ST Plus Fanzine Issue #29 now in stock!

Many GREAT used software and hardware items, along with accessories and
full version Shareware games for your ST - STe - Falcon.

Video game carts, systems, and accessories for your Jaguar, Lynx, and Classic
(2600-5200-7800) Video Game systems.

Visit our website by pointing your browser to:
http://www.mcs.net/~isis/dungeon/dungeon.htm

or call 708-547-7085 10am to 5pm CST Monday through Friday.

Thanks for taking the time to read this and we look forward to helping you with
all your Atari needs.

or
>somthing.
>did anyone try it?
>did it work?
>just thought i'd ask before i sent off for the bits.

I haven't seen this particular expansion, but I know that it's possible to get an extra midi out on the modem port with just a couple of very cheap components (I've used it myself before I bought the Falcon) - I can't find the schematics for it right now, but I seem to remember there were only one or two resistors and maybe one diode... It works perfectly and uses the Export driver in Cubase in all ST/STe etc... - but it doesn't work on the Falcon at all - for the Falcon you'd need to buy SoundPool's MO4, which gives you 4 extra midi outputs from the printer port.

Best regards,
Claes

Terry,

> Anyone have Dr. T Sequencing program they're willing to sell?

I don't have any more Dr. T's sequencing programs, but I do have Binary Sound's EditTrack Gold for sequencing still available, as well as EZ-Score Plus for scoring. Both are still in their original shrink wrapped packaging. If interested, drop me Email and we'll work out a fair deal.

Sheldon

Run GEM-View on an emu. Or even simpler, view the PI2 using whatever on an emu, and snap a screenshot... (Pacifist should do this quite nicely...)

I could probably hack a degas to PCX converter in DOS given some time, if you can get me interested in it... :)

>I suppose it's one of those PC BIOS tricks that remaps it.

Yup, it requires BIOS support to look 100% like a floppy. Otherwise I would guess you can't boot off it, or use it at all until a driver is loaded....

Been thinking about buying one of those for my PC. Its recent enough to have support... :)

Since its an IDE device, standard IDE limitations apply. Actually, I saw an external LS-120 drive, I can't remember if it was parallel or what. Of course, then standard parallel limitations apply...

The earlier STFM's used 1meg X ! bit chips at 120-100nsec. Some of the
later systems used 256k X 4bit chips. at 120-100nsec. I think that maybe
the mega series was the first to use simms but perhaps not. PACMan

Also try Wizztronics. They sell a plug in RAM expansion board that
replaces your existing 4 meg board, allowing you to plug in a standard
16 meg SIMM, which will give you 14 megs on your falcon (the falcon
uses two of the sixteen megs to access the other fourteen, which is
why you don't get sixteen megs from the upgrade). The RAM board costs
about 75-100 dollars US. And RAM is getting very cheap, probably less
than 40-50 dollars now for a 16 meg SIMM, (I haven't followed RAM
prices for a few months). Many mail order Atari dealers carry
Wizztronics RAM expansion boards in their regular stock as well.

> And of course you must switch on the cookie support in CAB.

I was able to log on to this page - but with a lot of problems.
It made no difference weather CAB.OVL was configured to fake Mozilla or
not.

The problem Dennis is referring to is when you try and become a member.
You can get through the first two pages, but when you send the final
information, while it is sent, CAB returns a "Transaction Failed"
message. However, it did go through. Then when you actually use the log
in page, you again get the "Transaction Failed" message. However, if you
reload the page, the little red indicator button and meassge that you
are not logged on changes - the button turns green and the message then
reads that you are indeed logged on. After that you can use the services
that are available for members.

One additional bit - when trying to access the page that allows you to
by-pass the main Recycler home page for future access, CAB (CAB.OVL)
just stalls after some info is received and sent. At this point the only
way you can recover is to kill the program or do a warm reboot.
```

I have the following games available for trade. If anything isn't clear, please feel free to ask. I'm looking for Atari 2600 games and items that I don't have. See my web site (below) for my full Atari 2600 want list, as well as my full trade list. Please do not ask me "how much is X" as I do not have set prices for these.

Auto Duel w/box, map, manual, reference card (Apple II)

Fahrenheit 451 w/box, manual, insert, reference card (Apple II)

Infocom 4-in-1 sampler disk only (CoCo II)

Infocom Deadline box, folder, tablets, interview, ref card, photo, memo, lab report, coroner's exam, letter to chief, casebook (Large folder style, no disk) (MAC)

Infocom Mind Forever Voyaging w/box, Dakota, map, pen, decoder (Apple II)

Infocom Moonmist w/box, "Ghosts", 2 letters, visitors guide (disk is copy) (Atari ST)

Infocom Moonmist w/box, box, Ghosts of Cornwall, ref card, visitors guide (IBM)

Infocom Seastalker w/box, map, decoder, 8 cards, badge, log book, start guide(Large folder style)(TRS-80)

Infocom Seastalker w/box, logbook, 4 cards, decoder, chart, badge (IBM)

Infocom Wishbringer w/box, envelope, map, "Legend" (IBM)

Infocom Witness w/box, note, telegram, matchbook, "Santa Ana", "Nat'l Detective" (MAC)

Might and Magic w/box, book, adventurers guide, and map (IBM)

Moebius w/box, map, book, reference card (Apple II)

Ogre w/box, manual, strategy guide, reference card (Apple II)

Snipes w/vinyl binder, warranty, & dox (1982) (IBM)

Ultima II w/large box, book, business reply, and memo from SOL (Apple II)

Ultima II disk 2 only (Apple II)

Ultima III (shrinkwrapped) (Apple II)

Ultima III w/box, cloth map, 4 books, note from Lord British, reply cards (IBM PC/PC Jr.)

Ultima III w/box and 4 books (MAC)

Ultima IV w/box, cloth map, 2 books, reference card (Apple II)

Ultima IV disk 2 only, sides C & D (C64)

Ultima V w/box, cloth map, amulet, book, diary, ref card, quick ref card, quest for clues (Apple II)

Ultima: Savage Empire w/box, reference guide, start guide, map, magazine, catalog (IBM)

Steve Stupple a ï¿½crit:

> If I remember correctly the SH204 hard drives are MFM drives and not SCSI, I
> was also informed that it wouldn't be cost effective to upgrade these drives as
> they can only cope with small size drive.

Yes, but from what I've gathered on these groups (I've never seen one of
these SH drives), they are made up of 2 adapter boards, ACSI to SCSI,
then SCSI to MFM. Therefore it is possible to bin SCSI/MFM part, and
plug a SCSI drive into the first adapter. Several people have done this
apparently.

Why Atari didn't go directly to SCSI is beyond me.

Cheers,
Nick

When it loads a midifile, it has to load the needed samples too. Then it has to sort out all the data before playback starts. So 25% faster from one upgrade to the next is pretty good! :-)

You'd get a much better response to your news about the new mouse adaptor if
you wrote in ASCI Roy!

It's this bloody PeeCee :-(I have had trouble configuring it :-(

I think it's ok now :-)

Anyway - a mouse adapter for running PC mice, trackballs, etc in the Atari
mouse port will be available soon :-)

Watch out for announcements in all Atari message places :-)

Yours Roy

But for those who don't have a spare serial port -

"The Atari Serial Mouse Interface" will be available soon :-)

Plug a PC mouse, trackball, etc into the Atari mouse port and it will work
:-)

Watch this space for announcements :-)

Yes. I'm a bit confused, too.

I wonder what interaction there is between the 'WDialogue' printer
setting and those set by e.g. the NVDI 'Printers' CPX.

I spent ages messing about when trying to print a graphic from CAB. I
haven't yet rationalised what was going on.

IMHO, Wdialog is a pack of troubles. I avoid it like plague,
as it bends all sorts of system vectors and makes applications
crash in an unrecoverable way... until your next reboot.

The Behne brothers really ought to fix their code, cause 1.98
is barely usable, while 2.00 downright makes CAB crash as soon
as I attempt printing...

925. Newsie 88 Full Groups List

Newsgroup: comp.sys.atari.st
Date: 1998-06-17 00:00:00 UTC
From: wordwork*@ctos.com
Message-ID: <3587da38.0@news.weldlink.com>
Source record: 98944

I suspect that Newsie 88 has problems downloading a full groups list from my ISP.

I had my ISP's network administrator email me their current list as a text file. Newsie's group list is also a text file. The ISP's list is about 15,000 lines longer than Newsie's list. I do mean lines, not bytes. Edith will give you the line and column number for the cursor location, and that is how I determined the number of lines.

I attempted to do a side by side comparision of the two files, but the ISP's list is not sorted, and I don't have the RAM to sort the list.

Any thoughts?

STFM DMA 19 pin ext. Drive ?
################ DMA 19 pin ##########
################--------------##########
################ OUT IN ##########

^
|-- Open Case, use the internal SCSI
BUS to add your CD-ROM
But that work only if you have
a SCSI Device in your external Box!

Into you external Box:

Link
(DMA to SCSI Adaptor) SCSI Device
######################## SCSI Out, 50 pin flat #######
########################------------------------#######
######################## #######

Remove 50 pin flat, replace it with a longer one with tree connectors..
Fit your CD-ROM to the third connector of that new flat cable.
Remove terminator packs from your SCSI Harddrive, instert (or switch on)
termination on your CD-ROM. Connect 4-way power plug at the same scheme
as on your SCSI Harddrive..

Watch for SCSI IDs! Harddrive 0, SCSI CD-ROM 1,2,3,4,5 or 6
Don't use any SCSI ID twice!

Use a Software CD-Driver..

If you external case smal, take a bigger one. (eg. for two devices)
CD-ROM 5.1/4"
HDD 3.5" ?

Sorry for simple english..

Regards, Robert

I just acquired a package deal on some hardware and software. Much
of it I already have or simply don't need. So I'm not leaving Atari,
though I do have the following for sale, in North America:

HARDWARE:

NEC CDR-25BJ 1x external CD-ROM drive
(includes All Things Falcon/GEMini Atari/
plus two adult CDs) $30
US Robotics Dual Standard 14.4k modem $15

I also have many cables, so if you're looking for a cable, ask and
I'll see what I can come up with.

SOFTWARE:

AtariWorks $20
CodeHead package (CodeKeys/HotWire/
LookIt&PopIt/MultiDesk Deluxe/
Utilities/Warp 9 w/Extend-O-Pak) .. $20
Imagecopy 4CD $20
STalker 3 ..... $10
STraight FAX! 2.2 ..... $15

Also, choose one each of the following for FREE, for every piece of
software you buy:

DC Utilities 2.0c
Diamond Edge 1.1
Hard Drive Turbo Kit/Turbo ST screen accelerator
MultiTOS (Atari release)
Spectrum 512
SpeedoGDOS (Atari release)
TV Sports Football

All software is on original disks and comes with original manual.

Prices do not include shipping, though prices and shipping are
negotiable on multiple items.

* LED v1.51 * Blonde Klingons: Because it was a good day to dye!

atari jaguar 64-bit game console

with these games:
DOOM (the original)
CYBERMORPH (virus-like)
CLUB DRIVE (hard drivin'-like)

and these axx:

scart cable (round tv cable)
stereo av lead (for stereo sound and/or yellow video
input)
1 joypad

why i sell it: i bought 2 of em to play doom in jaglink, but the link
doesn't work properly.

price: 4500 bef.

what ? you're not interested ? it's only 4500 bef for a new version of
the one and original doom: 64k colors, ultra-fast, no savegame (but
level choice) (it means: no savegame abuse), fading effects, new
levels, no crap music during play, more blood ...

Hi,

today I fetched the morning session of Newsgroups at around 09.00, went to
work and fetched the evening session just 15 minutes ago...
Discovered that my ISP has renumbered ALL the articles in every newsgroup.
So the offline reading started with sometimes more than 500 msgs pouring in,
I just broke it off, got the latest numbers in every group from Newsies log
and start from there. So if I miss a message or two, don't blame me.
I'm trying to pick it up from June 16th or so again.

You don't need to have XCONTROL installed as an ACC, as it is able to be
used as an APP as well. This means the memory is only used while it's
on-screen. For a low memory system the additional double-clicking is far
outweighed by lower memory burden.

As for linking the STinG activate to the enable/disable button, I'm not to
sure. If this was used with the net-connected machine in an local net, it
could freeze the local net until re-enabled again. Another way would be to
allow the dialer to enable it if it's not enabled, but not to disable it.
Then again, if the dialer can check to see if IP-Masquerading is being used,
it can tell whether to turn STinG off, or not, at the end of a connection.

The answer is that yes, this is still true.

I don't have the details of the policy (it's dealt with by the treasurer),
but the opinion is that it might be better to check one's home insurance
policy.

There is also the issue of 3rd party damage which I'm not too sure about.

Speak to 'ya later!

b>
b> The one at http://www.megacom.net/~q-funk/download.htm definitely
b> does mention a DS1216E, not 1215. These are piggyback chips that go
b> between one of the ROM chips and the socket. I think the 1215 is a
b> normal socket chip.

You're quite right Nicholas, I must of been having a bad day! :-)

The DS1216E is the clock module and the DS1215 is the chip fitted to the
F-M-Clock, using an external battery and the usual crystal.

b> Note that the E is the 28 pin piggyback chip, and the F is the 32
b> pin,
b> so if you have TOS 2.06 in an STE, you would need the F version. I
b> haven't tried it though.

And it won't fit in some STs anyway, due to the lack of headroom with the PSU
located above the TOS ROM chips.

b> The upgrade looks pretty simple, and more elegant IMO than using up
b> the cartridge port, however the problem is the availablitiy of the

Agreed, although the docs for this version (which I've since deleted) also
mention that the chip could be placed in a cartridge.

b> DS1216 chip. I inquired about getting one from Dallas, as they do
b> sell small quantities for prototyping and stuff, but it turned out to
b> cost more in shipping than for the chip itself. No local sources
b> could get the part for me.

That's a shame, the Dallas distributor in the UK sent me a sample "freebie",
I did say that it was to repair a PC, to my eternal shame.

I couldn't get it to work, which didn't help either, although I've still got
it :-)

Speak to 'ya later!

947. Arkanoid problem (STE)

Newsgroup: comp.sys.atari.st
Date: 1998-06-17 00:00:00 UTC
From: Tony Wright <Tony@apsoft.demon.co.uk>
Message-ID: <r5vFdAAiXBi1EwL2@apsoft.demon.co.uk>
Source record: 98966

I have a n original Arkanoid wich no longer appears to work om ny STE (it works OK on the much older ST). Main problem is that after the intro screen has appeared and it looks as if the game is going to work, the mouse does not respond, although the ball starts moving, demolishing bricks and producing the correct sounds. This means a game lasts about 10 seconds but with no user interaction (including telepathy). The game definitely used to work, I was wondering if anyone has any knowledge of this. (Oh yeah, the 4 inch cure (TM) doesn't help.

I have turned on cookies in 2.7 demo, I logged onto that page, I
get to the 2nd page that asks for my username/password, I do it
and then see about 300 to 600 bytes come in, the message at top
says connecting to host and 10 to 15 mins later I have to hit
reset to get out of it.

I use the monospaced font that came with Edith (the text editress). A very legible font, consistent, pretty, and a refreshing change from the squatter looking fonts more commonly found. I highly reccomend it. I think the distribution policy of Edith will require that you download it to get its font (i.e., I don't think I can just mail you the font or post it at a web site), if you want to try it. But I could be wrong.

955. fVDI v0.85 released!

Newsgroup: comp.sys.atari.st
Date: 1998-06-17 00:00:00 UTC
From: rand@cd.chalmers.se
Message-ID: <6m9jh2bdu1@nyheter.chalmers.se>
Source record: 98974

fVDI, the Fenix/Free/Fast VDI, has now reached a stage where it's actually very usable, IMHO.
I think I've fixed most major problems (I finally found the CAB/AtariWorks bug) and the speed is quite good in both monochrome and 16 colour modes.

I can only run fVDI on my Falcon+AB040 myself, but from what I've heard it runs fine (and reasonably close to, or even above, NVDI's speed in monochrome) on both STs and ordinary Falcons as well.
(On my machine fVDI v0.85 is significantly faster than NVDI in monochrome.)

Lots of things are still not implemented, for example
- text effects or horizontal alignment/justification
- arcs, circles, ellipses, pies, markers
but what's there seems to be enough for most programs.

In 16 colour mode, only black and white text, mono-expand blits and pattern fills are currently possible and text is only partially accelerated (should still be faster than the standard VDI). Unlike in the last pre-release (or the version I showed at NAS last weekend) the normal blits should now be fully operational, though.

I'm of course interested in bug reports and performance numbers from various hardware. Especially, though, I'd like to hear from people who'd like to help develop this program further. As can be seen from the included 15/16 bit device driver sources, porting fVDI to new hardware is really easy.

You'll find fVDI, and lots of information about it, on my WWW pages at the address below.

This underlines the importance of free portable source
code availability for graphics formats, which guarantees
that you can transport your images anytime and anywhere.

The ximgtool package for example provides portable C
source code for all kinds of the IMG format, and just
recently I derived a converter to the PNG format from it.
I did not even compile and run it on an Atari (no need
until now), instead just copied my IMG files from Atari
to the Linux PC and prepared them for Web usage
(see http://www.cdrom.com/pub/png/ and
http://www.esc.de/homes/guivol/1stguide/snaps/).

960. Need Help w/ Compatibility+ Board Installation

Newsgroup: comp.sys.atari.st
Date: 1998-06-17 00:00:00 UTC
From: Charlie Wood <spidersi@sprint.ca>
Message-ID: <898151696.555614@michelob>
Source record: 98979

Hi

I picked up a Compatibilty+ board and TOS ROM's 2.06 to install into my Mega ST2 so I could add the
Marpet Xtra RAM 8Mb card.

I desoldered my CPU and removed the TOS 1.2 ROM's (there were 2 chips) then soldered in the Compatibility+ board with 2.06 ROMS. I didn't put the 1.2 ROM's back in to keep things simple (I was going to add them later)

Q: do I still need to connect green wire to pin 20 of old ROM socket if I'm not going to have both TOS versions.

I put the Mega back together, turned it on... nothing, the floppy light doesn't come on, monitor flashes when I turn the machine on but that's it, dead, kaput.

I haven't added the xtra ram card yet, I thought I would test the Mega after each stage of the upgrade.

I used a ground strap while working on the mother board, checked for joined traces, cold joints everything looks fine.

If someone who has installed this board before could help with some troubleshooting tips I would really appreciate that.

Charlie Wood

Logic certainly works under MultiTOS - considerably better than most programs!
The MIDI timing seemed to be okay when I tried it on my Falcon, but screen
redraws were too slow (I tend to stick to single TOS mono for MIDI work now).

I've also heard that it works under MagiC, but can't confirm that for certain.
I also don't know about N.AES, but having used it a little bit, I have to
say that I really like it as an OS - I just wish there was a UK distributor.

Personally, I'd stick with booting back into 1.62 for MIDI work - although
I'd probably get an upgrade to 2.06 so the transition isn't too bad...

Ahh, but does it offer the ability to simulate a double click using a single
click - which is what the original poster wanted?

BTW, for anyone interested in my EJP experiments, this convertor could be
quite useful, as one of the forthcoming projects is an Atari mouse -> Joypad
convertor (ideal for Jag games like Theme Park); with this convertor, it sounds
like you could also use a serial mouse (obviously easier to get hold of, and
with more options in terms of styling and the like).

value however..) and some wire......
>

Yep, that sounds like the one I built all those years ago. The resistor values
are arbitrary-ish; MIDI uses a current loop system, RS232 is a voltage driven
system, so the resistor values are used to set up the right current flow (I
think; just don't quote me).

If anyone tries this, here's a handy tip: Ifor the DIN socket, try to buy
one in which the cover (assuming a line socket) is in two halves (two trough
like pieces) that screw on - i.e. not the sort with a 1-piece cover that you
slide up the cable. Normally you'll have to splash out a few more pennies
to get this sort; the covers are normally metal, or faux metal rather than
the plastic of the other sort.

So why get this sort? Well, when you solder it together, keep your wires
nice and short, and you should be able to assemple it so that the MIDI socket
sticks straight out of the serial connector - i.e. with no length of flex
in between. This makes the whole unit look neater, and more robust (no cable
flexing and chafing).

Sure, currently it doesn't recognise disks with bad bootsector or length,
but the programm is still under development. If there are some potentioal
users, please mail me what to improve.

> it's a good approach for moving files between the emulator and 'the real
> thing' if you don't need to write a full disk image.

Definitelly this was the main reason to make such a progamm, because the
old MSA II+ dosn't allow that.
And as the PaCifiST came it was really simple to add ST fie formatt
support.

If you don't have NVDI, fVDI will speed up your graphics (in monochrome
and 16 colours), but you'll currently lose some functionality (no circles
or text effects for example).
Most of the programs I use work very well indeed with fVDI v0.85.
Naturally, the monochrome device driver would work on a graphics card
as well in a mono mode. The current 15/16 bit drivers are _slow_, however,
so I wouldn't recommend that you use those.

It's possible that a TT with FastRAM is fast enough that you can turn
on the shadow screen in fVDI and get a speedup. I really do think you
need an '040 for that, though.

If you do have NVDI, there's probably not much point in using fVDI right
now (apart from helping the project along by reporting bugs), since the
speed is most often not better and you'll lose vector fonts and printer
drivers (among other things). fVDI should work (I have never tested it,
but there's not reason it shouldn't work) with proportional system fonts,
though, which supposedly NVDI4 does not.

fVDI is more of a project for the future:
- It's free (as in GPL)
This means that anyone can help out or write their own drivers.
It also means that things like FreeType (a free high quality TrueType
(and soon PS Type 1 and 2, it seems) font rendering engine) can be used.
- It's easily portable
PCI cards can already be used on some of the clones and there have
been rumours about boards for the Falcon as well.
Device drivers could also be written in native code on emulators,
giving nice fast high resolution true colour modes in for example
PaCifiST, TOSBox or STonX.
- It will be usable as a Fenix shared library

Personally, I use fVDI more and more, since the shadow buffer is really
good for scrolling windows with my AB040 and the small system font (which
I always use when editing text) is drawn a lot quicker (up to five times
faster) than with NVDI.

>BTW, has this "Fenix VDI" anything to do with the new french clone Phenix?

No, but it has something to do with the OS replacement project Fenix
(there's a link on the fVDI top page). The two are not related.

967. Alternative keyboard layout and text editors

Newsgroup: comp.sys.atari.st
Date: 1998-06-18 00:00:00 UTC
From: ut13@rz.uni-karlsruhe.de
Message-ID: <35891100798e68@rz.uni-karlsruhe.de>
Source record: 98849

Hello,

I have an Mega ST 2. For the moment, I haven't found a program
to change the keyboard layout and to allow me using two alternative
layouts. I have tried KBEXT, but it changed the keyboard to some random
values. Maybe it is incompatible with some other program. Does anyone
have the same experience.

There is a second problem. The editor I use (TEMPUS) seems to ignore
such keyboard tables and uses it's own keyboard handling. TEMPUS hat a
character table to chose special characters, but I need a keyboard
for writing texts.

So I am looking for some of this solutions:
-a working keyboard changing program combined with an editor that will
not override it
or
-an editor that will let me setup it with an alternative keyboard.
Actually I would need also to swich easy between the two layouts.

Could anybody give ne some advice?

Bye
Guentcho

> Nope, Think about it, the Amiga blitter was way faster than anything the
> 68000 could do, on it's own. You haven't seen too many Amiga demo's then?

Have have seen more Atari then Amiga demos, but I think that I was
pretty
well informed on the subject of vectorgraphics on both machines in
some lengthy discussions with Kaos from Sanity (Amiga) and Rapido from
Synergy (Atari). Comparision of relevant material let us to the
conclusion that the faster clock of the ST was enhough to compensate
the Amiga blitter.

The best polygons on the Atari are in the Synergy Mega demo, I think.
I am not sure about the demo names of the Amiga vector screens, one
inmpressive was called 'Vector graveyard' or something like that

Note that the smaller the polygons get, the less use the blitter of
the Amiga gets, its great for filling huge polygons, no doubt, but
when the number of polygons grow the advantage of the ST higher
clockspeed grows. Add to that some tricks you can use to speed up
updating huge polygons and the ST gets the lead.

Hiya,

I first tried PacifiST 2 years back and it was interesting. I have revisited it and got hold of 0.48 and 49 Beta and DosAssist and loaded it on an IBM ThinkPad P75.

Now, some probs to report and advice sought.... There are some keyboard mapping problems.

The nmo; 90 characters are jumbled and / or not available under PacifiST or after it has been run under either W95 or DOS...?? This makes things awkward.

I have also tried out a couple of games. A GEM game - Risky - works OK, but on my boot disk, it utilises NVDI 2.5 and this upsets the screen drawing so that it does not refresh...

I initially, successfully created a diskfile image of Final Whistle (one of the Kick Off 2 games) and got it running (useless without a joystick tho'!) but then, on trying it out again, found it would not boot.
I was inserting the disk in floppy drive A and booting Assist or PacifIST so that it would see it. It appears to be corrupting the boot sector each time?? Perhaps there are specific measures I am missing - I have spent 6 hours solid on this!! I am using MSA_ii_3.prg to unpack/pack the msa files. They seem t come out at about 810Kb, so can you advise on formatting proceedures. I have been trying the std 720Kb ST (too small) DOS 720Kb (likewise) extended 'Fast Copy' format of 830Kb using 10/80(via the ST) and the std 1.44kb in the PC under PacifIST...? I have read the doc, but nothing to help...?

Other than that, the possibilities look interesting...

The site I got the files from is:

http://lgd.fatal-design.com/

Thank you for any help...

Cheers,,

Hello there!

Crown of Creation 3D, the ultimate space-action simulation for the Falcon030, finally got its own homepage!

After the overwhelmingly positive reactions of many players and magazines, now the latest facts on this standard-setting game can be accessed via internet.

Simply go to http://www.tu-bs.de/~y0001569 to see this:

- The story
- The features
- Test reports
- CPU-/DSP speeder support
- Online order CoC 3D
- Get the latest updates (V1.3b)
- Screenshots

All pages in Deutsch/English.

See you soon!

I also found that Newsie would not get the full list, so just
before I closed my CIS account, I used the capture buffer of
Flash 1.6 to capture the list there, this I printed out and have
in a notebook were I can get it. If a newsgroup I want to test is
not in the newsie list, I subscribe online and just type in the
groups name. Works that way for me.

When you get your G3, Try the MagicMac Demo and see if it works first.
You can download it at either ASH or Toad's (at the moment anyway) web
site. If it doesn't work, try NoSTalgia emulator. I have no experience
with either of these, but my wife and I are talking about getting a G3
Mac when we have the money, so I'd love to hear what happens!

I'm planning on doing the same with mine. Do the new Macs still use
LocalTalk/AppleTalk? Would it be possible to connect it to the
Falcon's LocalTalk port and use Sting and whatever Mac equivalent to
make the network connection? Anyone know?

Hej Johan,

OK, I only did some quick runs with it. First from MagiC, I had some weird stuff on my screen and finally MagiC crashed completely with the infamous "memoryblock destroyed" message.

So I ran from ST-high without an autofolder, this looked OK. Then tested it shortly in TT-medium, also with no autofolder and 2 or 3 ACC's running. Looked OK and quicker than the regular VDI to me. I ran MGIF from it in the two resolutions, no problems. Ran Gemview which sometimes had a minor screen redraw problem when scrolling a picture. Graftool had no problems at all.

Now I still got to set up the SYS file according to my liking and do some more extensive tests (incl. running the Gembench) but for working on my card in truecolor or 256 colors it's no good at the moment, since I need NVDI to drive my card (the Matrixdrivers never were good enough, not one single version of them).

Anyway, will keep you posted by Email.

BTW: is 0.85 the last one? I took the 85c, 85d and 85e files with the main archive, but are these predecessors or later updates?
Also (OK, haven't read the docs completely yet) do you set up the SYS about the same way as Assign.sys? i.e. different lines for the various resolutions? I just ran the SYS from the package and I just happened to have this bloody Monaco font in my Gemsys...

Message-ID: <898203211.25324.0.rover.c3adfca1@news.demon.nl>
Source record: 98876

Hi,

found something strange here:
I just tried to E-mail someone 2 files UUE coded, but it only takes one file. So far so good. Now the strange part:
I prepared e-mail nr. 1, then tried nr. 2, selected the file for UUE coding, next the editor comes in like it should, but the whole stuff doesn't show up in its window. The end is simply a message without any file attach.
Next I quit Newsie, started up again and could do another one with a file attach, the second again refuses to go right.... So in one program start of Newsie I can only prepare just one e-mail with a file-attach??????

Anyone with some lite, here??

995. 1 Gig Parpitions

Newsgroup: comp.sys.atari.st
Date: 1998-06-18 00:00:00 UTC
From: marksimp@-nOsPaM-integrityonline7.com
Message-ID: <35898122.0@205.238.18.7>
Source record: 98877

Hi,

I have a 1 gig Jaz drive that I use for Hard Disk Recording with Cubase Audio for Falcon. I am currently running HD Driver version 4.52 (I have v5, but don't use it because of all the problems that were being reported with that particular release). I want to partition the Jaz drive as one large 1 gig partion so that I can record an entire CDs worth of live material on DAT (from a concert I mixed), all at once to the drive to be later edited and dumped to CD. I need to be able to do this so that I can also record an entire CD's worth of material from customers DATs without having to interrupt (read babysit) the process to create new files on other partitions.

Does the version of HD Driver I have support this. There is a file called BIGDOS included with it, but I'm not sure how to use it, or if it is what I need.

Thank You

Martin-Eric Racine has made available a nice 'core' bundle of TrueType fonts:

http://www.megacom.net/~q-funk/download.htm

I recently downloaded the bundle called CAB Fonts 2 (ttf_font.zip). The archive contains Arial, Courier, and Times New Roman. Previous to installing Arial and Courier, I was running the combination of Life, Gothic and Monaco.

To see what other browser fonts most of the world is using (like Arial), take a look at:

http://www.eu.microsoft.com/typography/fontpack/default.htm

I was wondering if there is an archive of Atari related sound files.
Specifically, I'm looking for the little musical tune that went with the
jingle "Have you played Atari today?", should be 8 notes long. Or something
along that line. I just want to put it on my web page to play in the
background when the site loads.

Thanks!

>stuff on my screen and finally MagiC crashed completely with the infamous
>"memoryblock destroyed" message.

As it says in the documentation, I have heard about problems with MagiC.
I don't have MagiC myself, so any information on that is welcome.

One possible cause is the way fVDI currently is started after the MagiC
desktop (and perhaps various ACCs and applications) have already
opened their virtual workstations. This can lead to lots of problems,
but under normal TOS they usually aren't fatal.

>So I ran from ST-high without an autofolder, this looked OK. Then tested it
>shortly in TT-medium, also with no autofolder and 2 or 3 ACC's running.
>Looked OK and quicker than the regular VDI to me. I ran MGIF from it in the

It should be quite a bit faster than the normal VDI in monochrome.

Are you sure fVDI was actually running during all your tests?
Some easy ways to see that would be:
- The menu titles are drawn in the small system font right after fVDI
us started (this goes away later).
- No text effects (italics, underline etc)
- No line patterns
- No coloured text

>in truecolor or 256 colors it's no good at the moment, since I need NVDI to
>drive my card (the Matrixdrivers never were good enough, not one single

It's actually quite possible that one of the 15/16 bit drivers will work
with your card. NVDI will most likely have to be running before you start
fVDI then, though, and it will definitely be _very_ slow.

>BTW: is 0.85 the last one? I took the 85c, 85d and 85e files with the main

The ones with letters in the name are pre-releases and have now been
move to a subdirectory. The main archive is available from the WWW pages.

>Also (OK, haven't read the docs completely yet) do you set up the SYS about
>the same way as Assign.sys? i.e. different lines for the various resolutions?

FVDI.SYS is very similar to ASSIGN.SYS and will probably be more so in
the future. Right now the main difference is that there can only be a
single driver (the number is irrelevant) and that the device driver file
specified _must_ be the correct one for the graphics mode you start fVDI
from (well, at least if you want to be able to see what's happening ;-).

>I just ran the SYS from the package and I just happened to have this bloody
>Monaco font in my Gemsys...

The active fonts in that supplied FVDI.SYS are probably all from my
ConNect installtion.

>but the opinion is that it might be better to check one's home insurance
>policy.
>
>There is also the issue of 3rd party damage which I'm not too sure about.

First of all my comments relate to UK only I'm afraid, my knowledge of the Insurance Market elsewhere in the world is a tad sketchy! The general principles may be applicable depending on the liability laws etc. of that country.

Following on from my original mail which really referred to the question of insurance from the Clubs aspect, (in the UK!).

Your home contents policy will normally provide "personal" liability under the public liability section, sometimes called "occupiers" liability for incidents away from the home within the UK, some will extend to the EC as well. The cover generally applies to the policyholder, spouse/partner and members of the family permanently residing in the home.

It is unlikely that you will find the cover under the buildings policy as the public liability section is normally only related to the property owners and not the occupiers aspect i.e. it relates to injury damage etc. caused by a defect in the structure of the house/flat.

Hope this helps a bit,

Trevor

1004. Superstar Ice Hockey - Info needed at Digital Sportspage

We are writing a feature on the six games that shaped electronic sports gaming. Superstar Ice Hockey (Amiga or Atari ST) was one of our selections, and we are in need of a screen shot from the game to run with the feature. Does anyone happen to know where I could find one? My Amiga died earlier this year, and I'm out of luck. Any help would be much appreciated!

Thanks,

Hi

Just a thought: When I have come across program that aren't very STE friendly
and all else fails, I use TOS 1.09 (the disk version) and run them under that.
I haven't got around to working a way of running a boot program yet but it does
help with program that can be run from the desktop:)

Cheers! for now
Steve

I want to get a Nemesis board for my Falcon, but now I've heard mention of the "work-alike" board from Centek. Does anyone here have any experience with this board, and is it really just as compatible/good as the Nemesis?

And, does the Videlity (resolution setting software) work with it?

Don't give up just yet. AIUI it's TOS 1.00 which is the problem (with STinG). I think you should be OK with 1.02/1.2 (depending on which numbering scheme you use). You will need to use HS Modem though.

Hi everybody,

On my homepage (http://www.mygale.org/11/toxicmag/atari.htm),
you will find some new releases :

- Sound Machine 3.2 (soundchip player using VBL, for ST/STE,
Falcon compatible)
- Texto! 1.4 (text converter for HTML, Windozz ASCII...)
- Ranma Chan Slide Show (well, this is just a slide show)

I'm also currently programming a YM player for ST.
(YM files come from ST Sound, which is a soundchip
emulator for... PC!).

PS: my homepage is in French :(((((

Source record: 98981

here it is!
it dead simple and it won't even invalidate your waranty ;-/
you'll be able to get the parts at tandys or somewhere.
i haven't done this yet but aparently the bloke from the magasine got it
working (danny mcaleer of "the mix")

pinout for midi plug:

3 1
5 4
2

pinout for modem port:

1 2 3 4 5 6 7 8 9 10 11 12 13
14 15 16 17 18 19 20 21 22 23 24 25

(both external port veiw)

you'll need a female 25pin modem conector
and a female midi plug as seen above (badly done i know)
and 2 220ohm resistors (this seems to be an arbitary value however..)
and some wire......

conect one resistor between pin 2 on the modem and pin 4 on the midi
and another between pin 7 on the modem and pin 5 on midi,
finally concet a bit of wire between pin 7 modem and pin 2 midi.

thats it !(for the hardware anyway)
now you need to get the export.drv file from one of stienbergs websites or
from the place that makes the noboxe expander who strangely have a more recent
version at:
http://www.cimplesolutions.demon.co.uk/prod1.htm#ExtraPorts

blah legal blah
toasted your atari? your problem..you knew the risks.

Midi plays at correct speed... always.
It is now mixing sound samples at about 25% faster ie it was 30K samples/sec
in ver 4.4 but with this version (v4.5) it's doing 38K samples/sec. That's
about 27% increase in performance.

Source record: 98984

I wanted to share this with you ... or ask about it, I don't know ...

I booted my Falcon with minimum of extras in MagiC to get as much memory as possible left for some application and I got quite surprised ... MagiC speeded up a lot! I started to check if there was some ACC or CPX or even AUTO proggie that was to blame and I found out that if I run XCONTROL instead of COPS my MagiC is a lot faster ... I don't know about ZCONTROL yet, but as soon as I find it I'm going to try that also.

The problem is that I couldn't measure the difference in speed by any means and I remember this benchmark proggie called GEMBench ... anyone supports it? Is there better choices? Where can I find some benchmark proggie?

Regards, K.Hampf

IIRC, Arkanoid uses a fixed memory address to get the mouse coordinates
and that address has changed with newer TOS versions.
I patched this myself many years ago to be able to play Arkanoid on my
STE, but I doubt I could even find the program now.

If you can get around the copy protection, the game should run fine on
an emulator if you have an old TOS ROM for it.

It shouldn't be that hard to fix the program if you know your way around
a debugger:
- Find out what the address used for the mouse coordinates (I believe this
was in the LineA variables) was in the old ROM.
- Do the same for the new ROM.
- Replace the address used in the program.
With luck the number in question is only found once in the program code.
Otherwise you might have to disassemble a bit here and there to check.

Hi Kevin,

just where did I hear that one? Gawd, I said this years ago...

So (then working under TOS) I tried several ways outta this. Grabbed
VDIfont.prg for the autofolder, kicked a few AES-fonts supplied with the
AESfont.prg package into my Gemsys and hey presto! I had new fonts in my
AES. All alertboxes too etc, not just the menu's...
Used a 7x12 font for quite a while, gave me a neat Mac-like look. Smaller
boxes, smaller menu's, it just did the trick. Plus: the AES fonts had all
characters needed for the system.

Working with MagiC it's even simpler: just put a replacement font in your
MAGX.INF and you're done.

I'll Email the stuff if you're interested

Thanks Harry!

It went out very well...
Yes, Martin was here alright and the weather was sunny these days, so I hope that he enjoyed his weekend in Gothenburg.

Falcon030 has limited address space to 24 bits (as every AtariST). Thus you
can get max 14 MB of RAM. The RAM board upgrade you mention above can't be
installed when you have more than 4 MB of ST-RAM, I believe.

Well, there was a project to get more than 14 MB of memory in Falcon030. It
was called FX-card. But it was never finished, unfortunately.

From: Oliver_Schildmann@LU.maus.de
Message-ID: <199806190000.a55398@lu.maus.de>
Source record: 98747

Hello Levien,

l> That's because these games use more or less the same code for calculating
l> the vector coordinates (probably not optimized for a particular system,
l> is easier when proting...), which is slightly faster on the ST.
Yes, *of course*!!!!

Both computers have the same CPU and therefore this is obvious.

But ...

l> The actual drawing of the graphics should be faster on the Amiga though...
... I understand what you want to say. Nonetheless, *if* the *drawing* is
faster on the Amiga, it is even faster if the CPU code is exactly the same
8-)

But the Amiga blitter accelerates 2D output, *not* 3D! For drawing "filled
polygons" the blitter is as usefull as a crap of wood.

Don't mix up these two totally different types of acceleration.

l> Have you seen "Another World" on both machines? Much faster vector graphics
l> on the Amiga version...
No, I don't. But maybe the developers are total different ones with there own
engines for calculating the 3D world. And if the Amiga got the better one,
the game is faster (no problem to make it the other way round ;-).

You can just compare games with the same calculating engine.

Greetings, Oliver

Hi Niall,

not completely... it looks like the functions of Wdialog expand with every update (now v. 2.x?) and so they do with MagiC updates.

No-one is able ATM to say "Do I need Wdialog next-to-MagiC or not?".

Not even the authors of Wdialog...

My experience running with MagiC 5.01 is that you NEED to run Wdialog as well for some apps. Jinnee for instance...

Not sure whether that changed with MagiC 5.11, 5.20 or now 6.00...

The Afterburner040 supposedly added a ton more 32-bit memory than
14Mb. Perhaps this upgrade uses the same techniques? Does it go
through the actual memory part of the Falcon board, or through the
PDS?

I am desperately trying to print a FirstWord document from my Windows95 PC. I am running PacifiST and using a HP Deskjet 820 printer. FirstWord Plus loads fine with PacifiST and so does the doc but when I try to print nothing gets sent to my printer. I've edited the ini file and even tried saving the doc as ascii-txt but still no luck. Any suggestions would be greatly appreciated. In fact, if you solve my problem you can have my Mega4 ST with color monitor and two Megafile 30 meg hard drives. I am not kidding. I just need to print this one document before I throw out my ST stuff. Thanks much!

Yes, I've had similar troubles, Louis, but my conclusion was that
there were some files which caused UUD.TTP to fail. I did not get any
further than this but now use MIME coding as it seems more reliable
and is acceptable to people with PCs.

I'm glad that it isn't just me then!

r> I wonder what interaction there is between the 'WDialogue' printer
r> setting and those set by e.g. the NVDI 'Printers' CPX.

Seems to be precious little TBH - even the printer that you've previously set
with NVDI's CPX gets reset to the Epson device.

r> I spent ages messing about when trying to print a graphic from CAB.
r> I haven't yet rationalised what was going on.

I can print OK but the extra step required to select the right printer and
with no apparent way to save that back means that WDialog's time on my system
is running out...

Speak to 'ya later!

> Just try CKBD 1.5, it's great. You should find it at
> ftp://ftp.lip6.fr/pub/atari/Utilities/ckbd_15.tos

Thanks, I saw it is great for combined characters, but it refuses to load a
.kbd table "Falsche Funktions #". (My TOS is 1.02 for German, but I've read
is should function with all versions of TOS. But maybe the CPX is written for
higher versions?)

Do you know what editors will let me use such recoding and which use their
own keyboard handling?

You wrote nothing about his system, except that he uses a Falcon.
My first guess would be, that he doesn't use preemtive multitasking.
I-Connect works only with preemtive multitasking (that means MagiC
or MTOS or N.AES/Mint). If he uses only TOS 4.x he should uses
STiNG by Peter Rottengatter instead of I-Connect. You'll find
STiNG at http://www.stud.uni-hannover.de/~perot/. You'll also
need a file CAB.OVL for STiNG so CAB is able to communicate with
STinG.

I really enjoyed my stay at Gothenburg. As I've said before it's a very
nice town. The first two days were a little noisy though due to the students
driving through the town hooting. They were celebrating the start of the
summer holyday I believe.

The pound sign is most certainly in the ISO Monaco font, Derryck. It's strange that it won't display for you. I do remember one character not displaying at all in qed's 'Character set' overview, but that problem went away after fixing a few non-related characters. Try the newer version of the font and let me know if the problem still exists. The Web page (http://www.excelprinters.com/monaco.htm) has a screenshot of all the extended ISO characters.

Titan do not have any more Afterburner040's

as the installer for Titan I can tell you that I fitted the last one last week and is now on it's return to it's owner in Hawaii. As far as I am aware the source for new Afterburner040's has now dried up so you will probably have to look to the second user market.

Sorry to be the bearer of sad news.

Okami, using POPwatch/NEWSwatch (work with either STiK or STinG, whichever you are currently using with NEWSie) for transport. Initial setup can seem confusing, but once you have everything up and running this is a very nice combination.

Okami can be found at:

http://www.xs4all.nl/~josdb/okami.html

POPwatch and NEWSwatch can be found at:

Terry, Not sure if it a CAB problem or a CAB.OVL problem - but the more
I use the 2.7 demo I think that both may be responsible. However, at
least for me, most forms work fine. Dan points out on his web site that
they are trying to fix the problems.

Perhaps you need to adopt a simpler approach: why use an emulator if
you have the real thing still there?

If you can't print to your current printer from the mega, you could at
least use it to save the doc as ascii for transfer to the PC or run
the doc through a converter such as 1WP2RTF to give you an RTF file
(with formatting intact) that you can load into your PC word
processor.

It won't fetch a complete list for me either. I think it's because it
can't handle the number of groups, or something similar, as it seems to
only store about the first 14000-15000 of then. There is another way to
get the latest list. Just use NEWSwatch to retrieve it. Once it's got
them, either copy/move the NG.DAT file into the NEWSie temp folder and
rename it as FULLGRP.TXT, or under Magic, make an alias of the NG.DAT
instead. I prefer the later as any changes to the full group file don't
require it copying over again, and it only occupies 8Kb instead of 624Kb.
The reason for it taking 8Kb is that's the size of one cluster. On a 16Mb
partition, with co-respondingly logical sectors, it would take 1Kb instead.

Thanks for the help! I have downloaded the "1wp2rtf" program but the
text file it comes with does not make it clear how to use it. If you
can give me some brief instructions I would greatly appreciate it. I
am trying to convert a file called FIXER.DOC. What do I actually put
in the command line? Thanks in advance!!!

I see. I am not quite sure what you are talking about but I have
been thinking it would be a great idea if the Mac/Amiga and ST users
united against Microsoft. It is time to end this petty bickering
and get to business. I would like to suggest for our first order of
business to e-mail, mail and/or call computer magazines and the like
and encourage them to cover other computer platforms other than Microsoft
based ones.

Please Let Me Know What you think.

Thanks

David

I wish I had your luck with forms. I probably have no better than about a 20% success rate. And that includes the ones that give an error, but in fact work (e.g. the MyMail mailing list form).

But it's good that it's being worked on. That's one of the most annoying things about surfing with my current setup.

Source record: 98798

Hello Mark,

m> I'll definately be watching what happens with you on this. I've been
m> talking to several others who are also considering a MagiC Mac/G3
m> setup (I'd certainly like one).
At the MausNet/FidoNet GfA basic group, a guy posted a small listing (loops and screen output) to make a little comparison between all the emulators on the different computer types.

One user had a G3 with MagiC Mac - he was *the only* user who couldn't deliver proper results: The test was *too fast* on his computer!!!!

This may give you an impression how fast this machine (and MagiC Mac) is. Not a single Intel (or AMD) came even close ...

Greetings, Oliver

Seems to me that this have nothing to do with the distributon package or the ASH apps.
This dialog you mention here is the last step that PPP-connect does during the connect, it waits for the DHCP IP-address from the provider.

Think he have a general problem, maybe he uses a script to dial on? why?
I use the PAP protocol both with STinG as well as with the PPP-Connect.

What does he used before PPP-Connect, a successfully dial-up with STinG?

I've used three versions of PPP-Connect, all the CAB versions. I never re-install these to get rid of problems, this is not the way to go.

Cross-posted to: comp.sys.atari.st,ny.forsale,rec.music.makers.marketplace

I have the following for sale.

1. Atari 1040 ST w 2.5 meg
2. Atari SM24 - 12 inch b/w monitor with speaker
3. Marcus track ball

Comes with cubase 2.0 and Dr T X-or with about 10 synth profiles. Also have some other non music software such as eliza (one of the first artificial intelligence programs) and a speech synthesis program where type in words and the atari says em back via the monitor speaker.

The systems is in really good condition works perfectly however to your liking or disling the computer monitor and computer were painted silver (which makes it look really neat on stage but a little strange next to other computers)

Im in NYC looking for about $150 for the system. Buyer pays shipping if

not local. I have the original atari boxes for shipping.
Thanks

I recently had to set up several internet accounts at work. We are using the same provider at work that I am using at home. The software for Windows 95 doesn't require that I put in the DNS #'s. Do I need to put these into the configuration in STing. The provider automatically gives the I.P address and the DNS.

BTW; I remember someone saying that PC's and win 95 were easy to set up because of plug and play. I installed new modems at work and found that Plug-n-Play means Plug and Play with com port settings, irq settings, jumpers, and play a games of cards while you reinstall win95.:')

Is there any program that will let you use *.ST images on a Falcon.
It would be great to be able to make a disk image of my games and run
them from the hard drive. Forget about Doom... I would love to go
back and finish DM and CSB. I just don't have the patience for long
disk accesses. If we can use the images on an emulator, why can't we
use them on the real thing.

Hi, all

I have an Atari Jaguar with 56 games for sale. I have boxes and instructions for everything. Most games only played once to make sure they worked. All but two games were bought new and they are noted on the list. I am asking $500.00(US) which I feel is real fair for everything you get, which makes it only about $8 per item. If you are an Atari collector this is a great investment. Will sell only as a whole package.

Here is everything I have:

Jaguar unit
Jaguar CD unit
2 Jaguar controllers
1 Jaguar Pro controller
1 composite video cable
1 Gravis Blackhawk Joystick (modifed to work on the Jaguar)
1 Memory track
1 Team tap

Games (cart)
Alien vs. Predator
Atari Karts
Attack of the Mutant Peguins
Breakout 2000
Brutal Sports Football
Bubsy (used)
Cannon Fodder
Checkered Flag
Club Drive
Cybermorph
Defender 2000
Doom
Double Dragon V
Dragon The Bruce Lee Story
Evolution Dino Dudes
Fever Pitch Soccer
Fight for Life
Flashback
Flipout
Iron Soldier
IWAR
Kasumi Ninja

Missile Command 3D
NBA Jam
Pinball Fantasies
Pitfall
Power Drive Rally
Raiden
Rayman
Ruiner Pinball
Super Burnout
Supercross 3D
Syndicate
Tempest 2000
Theme Park
Trevor McFUR
Troy Aikman Football
Ultra Vortex
Val D'Isere Skiing and Snowboarding (used)
White Men Can't Jump
Wolfenstein 3D
Zero 5
Zool 2
Zoop
Games (CD)
Baldies
Battlemorph
Blue Lightning
Braindead 13
Dragons Lair
Highlander
Hover Stike 2
Myst
Primal Rage
Space Ace
Vid Grid
World Tour Racing

Buyer pays all shipping charges.

Its that time of the month again (please, no comments!) <grin>

This month, Chris Hall won a 6 month/3 volume subscription to
Atari Computing, and just by calling The DarkForce! BBS at least
one time... ;-)

Don't worry, you too could win this same prize just by calling at
least once each month (even if its a 1 minute call!). Go ahead,
be brave, take a chance. Who knows-you might be the next winner!

At DarkForce, we put out money where our mouth is...Ask your Sysop
what he is doing for his Atari users today! ;-)

1095. FS PX etc: Atari STuff (20/6/98) Update

Newsgroup: comp.sys.atari.st
Date: 1998-06-20 00:00:00 UTC
From: steve@steverosie.demon.co.uk
Message-ID: <898369983.18482.0.nnrp-05.c1ed1184@news.demon.co.uk>
Source record: 98814
Cross-posted to: comp.sys.atari.st,uk.adverts.computer,neNYNm.uk.fe

I have a selection of Atari ST titles for sale.

This List Updated 19/6/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^
Prices DO NOT include postage.

GAME COMPILATIONS

Hollywood Collection (5d,ni) 5
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5
Paperboy, Overlander, Ghost'sn' Goblins
and Space Harrier (20 levels)
The Dream Team (5d, ds) 5
The Simpsons - Bart v' The Space Mutants, WWF Wrestlemania and
Terminator II 'Judgement Day'
Champions (3d,ds,nb) 5
Manchester United, Jahangir Khan Squash and
World Championship Boxing Manager.
Atari 520STE Discovery Xtra Pack 5
Language Disk DE1 (ds)
Final Fight Disks DE2 & DE3 (ds)
Sim City/Escape from the Planet of the Robot Monsters (ds)

9 Lives (ds)

SPORT TYPE GAMES

World Championship Soccer (1d,ds,nb) 2
Ballistix (1d,ss) 2
Superleague Soccer (1d,ss) 2
Vector Championship Run (1d,ss) 2

Win 95 does require DNS's - you need to tell the Dial Up Networking the DNS (primary and secondary) for the IPS that you are using. If the IPS dyamically allocates a DNS for your connection - this is automatic in both STinG and DUN (95). The difference is that with STinG you have to put the following string as part of the DIAL SCR. "GET_IP". DUN does automatically. OTOH I have TI Extensia Laptop that DUN refuses to work with - Microsoft, TI and Acer have yet to figure out what in the hell is going on. This has included a complete reload of Windows :). As I have my TT I really don't worry about it anymore.

I tried this for Canada only but no luck, so I'll expand this
to the U.S. and Canada. God I hate the exchange rate!!!

I might have killed my existing Mega 2 board installing
a compatibility plus II and TOS ROMS 2.06

So I'm looking for another Mega motherboard with minimium 2Mb's
I'll take a complete box if the price is right. I don't need monitor, mouse,
keyboard etc.

My address is below so please give the price of the board +
mailing/shipping cost

Thanks,
Charlie Wood

k> and au files in CAB (2.5). Does anyone know if WDIALOG is
k> downloadable from the internet or is it commercial software. Any
k> advice much appreciated. Thanks in advance.

You don't need WDialog with later versions of GEMJing.

Download it from http://members.aol.com/hoffart/index.html, it's shareware
but without a fee (which sounds odd!)

Speak to 'ya later!

Rgds, Derryck

>in the command line? Thanks in advance!!!

If you're unsure, do the conversion on a copy of the original file to avoid any problems. That said, it's very straightforward and shouldn't touch the original file at all. Just call me pessimistic :-)

Just double-click WP2RTF.TTP from the desktop and a box will come up for you to type in parameters. As far as I can tell the only parameter it accepts is the location of the input file (full path).

So (for example) if your FIXER.DOC is in a folder called DOCS in drive C: you'd just type in:

C:\DOCS\FIXER.DOC

in the box. OK it and after some whirring (the screen will probably go blank) it'll finish and when the desktop reappears you'll find a file called FIXER.RTF in the same folder as the original file. If it doesn't show up in the desktop window, do a rescan of the folder by pressing ESC.

If you have TOS 2.06 or later, MagiC or an alternative desktop such as Teradesk, you can just drag the icon for FIXER.DOC onto the the icon for WP2RTF.TTP (you may still have to OK a dialog box depending on the system).

To get the file onto the PC (anticipating your next question: apologies if you have this bit sussed already!), use a 720k floppy (not 1.44Mb ones as the Mega won't be able to read them) and format it on the PC. Be sure to avoid using Win95 long filenames on it, though, or the Mega will get confused. The PC won't be able to read a disk formatted on the Atari unless it has TOS 1.4 or later, or you use a formatter like DC Format which can DOSsify the floppy.

Hope it all goes smoothly!

John

N> #'s. Do I need to put these into the configuration in STing.
N> The provider automatically gives the I.P address and the DNS.

Just enter 0.0.0.0 in STinG for both the IP and DNS addresses. That's what I do here, as both are dynamic, like yours. That will ensure that STinG negotiates for both addresses. This also works in PPP-Connect.

here's a clue, TIFKAS - the Milan comes with a standard 1.44 floppy
drive (optional extra on iMac) and with a standard printer port for
industry standard printers (as opposed to the USB port on the iMac,
which has vapourware printers, scanners, and disk drives - not to mention
no way to backup your hard drive).

Maybe you should get a real web browser like CAB 2.5, which now has
an optional module (GEMtrade) that translates German web pages to
English before you display your considerable ignorance in this newsgroup again.

What I would do is save the text as ASCII, and load it using Wordpad,
or other PC text editing/word processing software, under Windows 95.
If no luck e-mail me the document, and I'll convert it to RTF or Word
or Lotus AMI-Pro format for you or even send you back a hard
copy.....And I'll gladly take you Atari stuff of your hands mate.

WDIALOG adds a few extra functions to the AES - these provide things like windowed dialogs, listboxes (little scrollable lists in dialogs), a font selector and a printer options dialog. It takes up around 80Kb I think. And as far as I'm aware, MagiC's AES has all but the printer dialog already built in.

Welcome back, Sinclap. And we thought we'd got rid of you. You posting from Deja News now? Noone wants to give you a real account? I wonder why...

Anyway, to your posting - If you read the bit at the bottom of the front page then you'll see that they say an English translation is in the works.

Besides that, most people know that specifications are the same in any language, so if you had looked on the page for "Produkt" (kinda looks like "Product" doesn't it?) and then perhaps "Der Milan Technische Daten" (sounds almost like "Technical Data" maybe?) you'd have found what you're looking for. See - all you have to do is use your noddle. But from previous experiences of you I guess I shouldn't have expected any intelligence.

And as you well know comparing specs of different machines is a fruitless exercise, but no doubt you'll go on anyway to massage your ego. We all know the IMac will sell more than the Milan. I know it. You know it. Everyone knows it. The point is: I don't care. I don't use these machines because they're the best/cheapest/fastest around. People don't drive Mini's because they're the best/cheapest/fastest around, either. But, hey, thats life.

Neil.

1118. TAF MonSTEr Flea Market July 11th

Newsgroup: comp.sys.atari.st
Date: 1998-06-21 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <358d40f3.0@diana.idirect.com>
Source record: 98703

SATURDAY, JULY 11TH, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 1:00 PM and will remain open until 5:00 PM.

This may be your 'last chance' to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

Not only is this an opportunity to buy or sell hardware and software for TAF members and other Atarians, this will also be an event whereby you can learn what you can still do with an Atari, including the Internet, Desktop Publishing, Scanning OCR, MIDI, and much, much, more! There is a confirmed Internet Demo (using the suite of available Internet prgs. running under STiNG), Howard Carson of MGI mentioned that he would be showing Calamus SL-98, and Martin Nueland will do a MIDI demo.

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

We are anticipating a good turnout and hoping to have some dealers at this event and thus TAF has booked a larger hall to accomadate everyone. To help defray some of TAF's costs of the event, the following will apply:

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admision is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is included. Admission for TAF members is, of course, Free.

The Flea Market will run from 1:00 PM to 5:00 PM, with setup commencing for sellors after 12:00 PM, noon, and teardown after 5:00 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Gold Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge.

Parking garage inside the complex - enter next to the Novotel Hotel on Parkhome Ave. Those comming by public transport can take the TTC's Yonge Subway, North to the North York City Centre Station, then walk through the tunnel into the concourse, down to the food court, turn left and find the Memorial Hall on your right.

Saturday, July 11, 1998, 1pm - 5pm for the TAF "Flea Market. To contact TAF on booking a table or tables:

Hi Martin
A French guy called Patrice MANDIN has made a great Doom engine
with the original sources of Doom.
I believe that his page is :

http://www.mygale.org/02/pmandin/index.shtml

The page is in French. You'll have to download a file called :

PMDOOMXX.ZIP (XX is the version number)

It's very slow but it works fine.
As far as I know, it doesn't use DSP for now but Patrice is
working on it :-)
Have fun.
Bye.

I'm going nuts trying to remember a game I had on my 520ST in 87
and as a last resort, I'm sharing my shame in the hope that someone will
remember it.

It was a side-scrolling game (for lack of a better term) where you
were a guy who was skateboarding through a museum. I know it doesn't sound
like much but it was a a lot of fun and it was the fist ST game I bought.

While I've got your attention, did anyone ever figure out what the
point of Time Bandits was? The game was graphically appealing and I could
play for hours but I never knew exactly what my goal was.

Enough rambling for today...

PS- Please CC replies to falco@vex.net, my news server isn't great.

1124. [POLL] Does anyone still play ST games?

Newsgroup: comp.sys.atari.st
Date: 1998-06-21 00:00:00 UTC
From: Mr Maddog <mrmaddog@microserve.net>
Message-ID: <Pine.UW2.3.95.980621190940.29674B-100000@reality>
Source record: 98709

Lately, I have been able to get back in the position where I can work on some computer projects that I would like to do. Although due to circustances which involve going to college, I will have to use a PC compatible...but if anything I want to work on the TOS platform even more. Plus I might be able to purchase a Milan in the future.

But with the way things are now, I'm not sure that if it would be worth my while do these projects which are related to ST games. So hence, this little survey you see before you. These questions are only for the purpose
of gathering information on the general idea of the ST using community, and nothing more.

Either reply to the newsgroup for all to read, send e-mail, or both...

1.) Do you still use any TOS platform computer?

2.) Do you use a PC, and if so which Atari emulator if any?

3.) Do you still play ST games, even occasionally?

4.) Assuming you can play a certain game on PacfiST, you would want to make a backup copy yourself for playing it on the emulator or look for it on the Internet? (Hypothically speaking, you are able to make a image to be used on PacfiST)

5.) Giving the current situtation of the ST platform, what are your feeling of copying commerical software and distrubuting over the Internet? (Legalities are well noted, just your honest feelings about it)

6.) Would you like to see ST emulators play more games?

7.) Do you plan on getting a Hades or Milan type machine in the future?

8.) If you have a high end machine, would you like to continue to play your favorite ST games on them if it was possible? (Not only includes 040 but also latest PC running ST emulator)

Remeber, your honest answers are most welcome...they may help me get a better idea on what the ST community would like. As always, thank you so much for your time :)

MagiC will work with cooperative or preemtive multitasking,
depending on the setting in the timeslice CPX. So if uses
the cooperative mode it won't work.

Another reason for the problem could be wrong/incomplete
setting in I-Connect. The ISP is waiting for some data which
is not send by I-Connect.

Yes - having been sent WDIALOG by two kindly souls, since posting my query, I am now ABLE to run GEMJing. I don't know what the connection is with the WDIALOG primary function but at least it does the job. BTW, my German is inadequate to figure out just what WDIALOG can do, if anyone knows.

Grateful thanks to everyone for their help.

I just got this programme from the www yesterday. It plays .wav files
OK but I found with the midi files that, for some reason, it would
stop every few seconds and then resume after a pause. Any ideas on
this? I usually play midi files through my synth but the possibility
of doing so through the Atari's own DSP seems great to me - if it can
be done successfully.

Cheers,

Just dig up the native DOS version, I've got it around here somewhere... ;)
Its actually better than the ST version, (IMHO) a well-done game for its
day, nice VGA graphics, mouse support, AdLib sound. It seems to run fine on
modern machines, though it'll bring itself down to run OK on my XT with CGA
gfx... :)

Howdy Bill and Steve,

Every STinG setup I've done requires a DNS number in the setup files. However,
you may not need a dial script if the ISP truly uses a PAP protocol. Lately,
I've found more and more ISP's just need the PAP info in your dial script.

If your experienced in STinG setups, PAP is a piece of cake. You just need to
try it and see.

If your using ethernet, Windows has DHCP support built in. DHCP is really
keen IMHO. Its a succesor to bootp. It will automagically and dynamically
configure client machines with an IP as well as DNS and other things. A
godsend to people configuring large networks...

If your using a windoze machine with DHCP, winipcfg.exe ought to tell you
whats going on...

>before buying papyrus, i must know, where can find drivers for the
>brother hj-100 and atari slm-605 printers ?

Papyrus comes with its own drivers for the Atari laser printer, or you can output via NVDI/GDOS which has its own driver for it.

I don't know anything about the Brother printer but my hunch is it will emulate either a Hewlett-Packard DeskJet/Laserjet or an Epson of some description which would mean you can use Papyrus' own drivers or NVDI/GDOS as with the Atari laser. You'll need to check the manual for emulation modes and how to set them. If you already have it working with NVDI/GDOS then Papyrus should just work with what you have already installed (though SpeedoGDOS or NVDI 3 or later are required for vector fonts, and NVDI is preferred as Papyrus is optimised for it AIUI).

Ask BEST-Electronics for a falcon IDE-Kit.

You got: Metal holder
2.5" flat wire
Some screws

Take any IDE from here:

Hersteller Bezeichnung Kapazitï¿½t Bauform

Hitachi DK222A-54 540 MB 2.5"
Hitachi DK212A-81 810 MB 2.5"
Hitachi DK212A-10 1.0 GB 2.5"
Areal MD2085 80 MB 2.5"
Fujitsu M2637T 240 MB 2.5"
Conner CFN250A 250 MB 2.5"
Conner CP2064 64 MB 2.5"
Quantum Daytona 500 MB 2.5"
Seagate ST9077A 2.5"
Quantum Europa 1.08 GB 2.5"
Toshiba MK1002MAV 1.08 GB 2.5"
Toshiba MK1924FCV 540 MB 2.5"
Toshiba MK2326FCH 330 MB 2.5"
Toshiba MK1403MAV 1.3GB 2.5"

and a lot more..

Complete description for fitting:

Hi Cory...have you opened it up yet? What I'm wondering is if it ever
had a hard drive in it. If not, you'll have to get the 2.5" IDE cable
and mounting hardware from someplace like Best Electronics...Its very
easy to install though... ;-)

The RAM's the problem Ken. The internal sort attempts to read as many
newsgroup names as there is space available in memory. A smaller
memory will produce (I think) a line in the LOG file indicating that
only a certain number of newsgroups could be sorted.

I have an ATARI 1040 STE in excellent condition its boxed with all start up disks and lots of applications its the curriculum pack it has all leads, mouse and a couple of games.

The computer works perfectly except the disk drive, which will require simple maintenance or replacement, because of this i am asking just £50.00 for it.

Email me loonie@globalnet.co.uk if you are interested or for further details

1155. FS:AtariST/MIDIsynthmods/software

Newsgroup: comp.sys.atari.st

I've got some synth modules and Atari-specific software to go with them for sale B/O:

Roland MT32, LA Custom Instruments/Robin Whittle mods, battery backup memory and controllers for reverb, S/N ratio cut to 85db or better even with reverb up full. Also, MT32 Capture! editing software. Many banks of patches on disk.

Akai S612 Sampler and drive/w some disks, lots of samples. Also Drumware sample editing software for same.

Manuals for all.

Royce

Nope!

They are 100Mb in size if that's what you mean, but i was talking about the
size of either the sectors or the clusters but then I've already forgot ;)

Is there anything I should be aware of with this process (parts, avoidances, etc.)? I just received a Falcon with no internal IDE and before I even opened it up I was wondering if there were any obstacles to putting a new 2.5" in. Thanks.

From: "K.Hampf" <k_hampf@yahoo.com>
Message-ID: <358df0f4.0@d2o29.telia.com>
Source record: 98714

I'll bring this up again .... with a different approach. What I wonder, is there any good tracker that can take advantage of the Falcon's sound capabilities?

I currently use Protracker v1.2 (multiplexed for 50KHz) which is still has the best user interface but plays only 4 channels and best at 22KHz. I've tried Digital 030 and Megatracker but they both seem so messy to use ... might be somebody else has other opinions.

The user interface of ProTracker is great and I've seen the FastTracker on PC which seem to have a very similar one ... but I want to use my Falcon! Any newer ProTracker for Falcon perhaps? OR should I take the step to professional programs?

Regards, K.Hampf

Talking about accelerators, does anyone know the status about
OXOs "Evolution" card? I have read that it's supposed to be
finished now and insteed of a 030 they have used a ColdFire
chip which is MUCH faster and it would be rather cheap as well.

Is this true or just a hoax? Anyone? OXO seems pretty dead
nowdays as well...

It doesn't matter where you plug it in as there is still only 24
address lines. To get more than 14MB you need something like the
AB040 which has got it's own CPU and extended address bus. You
could probably get more memory with the orignal CPU as well if
you use the PMMU and some soldering.

As I have said, the first version of fVDI I tried worked just fine under MagiC, so there is something somewhere which most probably is a bug which makes MagiC go bananas. MagiC is very picky about programs messing around with memory not allocated by the application it self. It could ofcourse be a bug in MagiC but I doubt it. You just have to be kind to it. ;-)

Hi all !

Now its time again for a new MyMAIL version
This time it got rev.nr 0.63

You can download from this address:
http://www2.tripnet.se/~erikhall/programs/mymail.html

Bugfixes and new things

- Now MyMAIL is taking less memory than before.
- Faster include of text in a mail after dropping the file into
the editing window.
- Wordwraping was incorrectly inserting a space at new line.
This is now corrected.
- The file mime.set is now controling how mime(base64) mail with
attachments are sent.
- Litle faster encoding of file attachments.
- Again there has bean problems with Outlook express
formated mails can send a application/octet-stream without any filename.
This files are now named msappl0.bin, msappl1.bin, msappl2.bin.... and so on.
- Timer checking of new mail are now done in background(thread) if MiNT is installed.
- Checking of new MyMAIL version is now done in background(thread) if MiNT is installed.
- A bug causing not released memory after a thread was terminated is now fixed.

The docs are not updated this time.

You can add or remove yourself from MyMAIL mailinglist.
The add/remove page is found at:
http://www2.tripnet.se/~erikhall/mymailupdates.html
The mailinglist are handled by MyMAIL automaticly.

Yep, Pacifist at the university,
STonX on the Alpha.

> 3.) Do you still play ST games, even occasionally?

Yes, esp. Match it, Crapman and Heartland 3.0 (while working on it).

> 4.) Assuming you can play a certain game on PacfiST, you would want to
> make a backup copy yourself for playing it on the emulator or look for
> it on the Internet? (Hypothically speaking, you are able to make a image
> to be used on PacfiST)

If the game is protected so it won't work on Pacifist the
easyest way is to go on the internet and get the 'fixed'
version overthere. Hacking the game yourself is too time
consuming and only worth the time when no fix is available.
Would you distribute the fix, or would you let others to
invent the wheel again?

> 5.) Giving the current situtation of the ST platform, what are your
> feeling of copying commerical software and distrubuting over the Internet?
> (Legalities are well noted, just your honest feelings about it)

No problems with it

> 6.) Would you like to see ST emulators play more games?

Rather would go for demo emulation. An emulator running all the
great mega demo's will have no problems running games. (Darkside
of the Spoon springs in mind.)

> 7.) Do you plan on getting a Hades or Milan type machine in the future?

Nope

> 8.) If you have a high end machine, would you like to continue to play

I can thoroughly recommend it; the only reason I don't use it much now myself is that it doesn't support LFNs, but back in my pre-multitos days, I used this all the time.

Yes, it has keyboard remapping (with user defined, loadable keyboard tables, as I recall), but absolutely tons more. There's a pretty good ramdisk, a diary/information manager type of app, a hex editor, caltulator, etc.

The best thing was that you could configure any app to appear with a keyboard shortcut, so I used to be able to call up a text editor from within any GEM application by just pressing ctrl-alt-e, or the calculator with ctrl-alt-c. Tjis may sound minor, but the increased functionality it provided made life a hell of a lot easier. I only hope we'll see a return to ideas like this as more programs support the AV protocol, and pass unused keypresses back to the AV server. Of course, we then need an AV server with a little more freedom over how you are allowed to allocate your keyboard shortcuts...

Anyway, I'm going off on a tangent now; suffice to say that HArlekin is great. If you're a serious user who doesn't utilise (or isn't worried about) LFNs, buy it now. Although I don't know what it's like under MagiC - anyone?

Oliver Schildmann (Oliver_Schildmann@LU.maus.de) wrote:

: But the Amiga blitter accelerates 2D output, *not* 3D! For drawing "filled
: polygons" the blitter is as usefull as a crap of wood.

Hmm, you might be right about the polygons, I don't know...
But still, 3D graphics have to be translated to 2D graphics before display
(CPU work, faster on Atari) and then displayed (line drawing could be
faster on Amiga).

: Don't mix up these two totally different types of acceleration.

OK, I agree on the 3D stuff...

: l> Have you seen "Another World" on both machines? Much faster vector graphics
: l> on the Amiga version...
: No, I don't. But maybe the developers are total different ones with there own
: engines for calculating the 3D world.

Ah, but Another World is a *2D* vector graphics game, thus faster on
the Amiga... Not much calculation, mostly drawing lines & polygons...
So there, you see, we were both right :-)

: And if the Amiga got the better one,
: the game is faster (no problem to make it the other way round ;-).
: You can just compare games with the same calculating engine.

The "engine" seems to be exactly the same, except for the drawing part...

Interesting. I've been using v2.00 ever since I downloaded the CAB 2.7 demo, and have had no problems. Of course, I never had any problems (that I'm aware of) with v1.98, either.

If you're using NVDI3 (or higher) with Papyrus, NVDI comes with a utility
that allows you to modify one of their printer drivers to create a new one.
I had to modify the HPLJ2 driver to work properly with my Okidata OL400
laser (the top page margin was 1" too low). It works fine now.

I have a complete Mega ST4 system and a TON of software for sale. Sale is open to all. I would prefer to sell the whole package as one lot, but will consider offers for individual pieces of software or hardware.

Package Price: $425 (US)+freight, or best offer. Inquiries should be directed to:

WFChris@aol.com

The package includes the following:
Hardware
1 Mega ST4 & Keyboard
2 Monitors; 1 SM124 momchrome & 1 SC1224 color
1 monitor switch box
1 mouse
1 joystick
1 MouseMaster switch box
1 ICD 44 mb Syquest drive
1 SF314 external floppy drive
1 Cannon BJ10e bubblejet printer
1 Supra Modem 2400 (ok, its not very fast, but it was good enough for GEnie)

Software
Applications
Calamus v 1.09.6 & 1.09N
Flash
Clean Up ST
Word Perfect
Degas Elite
Data Manager
Word Flair
various utility programs such as NeoDesk

Games
Maniac Mansion
Empire
Star Wars
Gauntlet
Warlock
ArcticFox
King of Chicago
Thunderbirds

r> the look of a complete graphic.

That's not what I mean at all. I'm talking about JPEGs that are on my drive. I'm not talking about web pages. So obviously there is no animated GIF involved.

As for what I mean by "as if it's animated," let me give you an example. Imagine a picture of a person with a dumbbell in each hand. Both hands are moving up and down, but the rest of the pic is completely motionless. And the separation of the animated part from the rest of the pic is clean enough to where it appears to have been done on purpose and not just some weird artifact.

23 Jun 98 @ 10:44:58:

r> This page looked fine in 2.5 and 2.7, with and without wdialog.
r> Any chance the Courier font got corrupted in some way?

Possible, but very unlikely.

r> What's funny, though, is that I have Courier installed for
r> preformatted text, yet it's used as the body text on this page.
r> Judging by the source html, CAB should have used Arial (normal
r> text) instead. It's almost like CAB decided to overrule my font
r> settings.

Interesting. That's my setup too, btw. (I just let CAB pick the correct
fonts for each type of text.)

r> This page looked fine, too. Courier is used again, this time in
r> the menu buttons.

<argh>

r> Did you install the Microsoft version of Courier or the Bitstream
r> version (spd_font.zip from Martin-Eric's download page)? I'm
r> using the Bitstream version with Geneva and NVDI 3.02.

Aha! That could be the difference. I'm using the True-Type fonts, assuming
they'd be better than the Bitstream versions. I'm also using a newer version
of NVDI (4.11, I think), but I doubt if that's it. I'll give the Bitstream
fonts a try later.

r> BTW, I tried some more of those free Monotype Web fonts from
r> Microsoft's site
r> (http://www.eu.microsoft.com/typography/fontpack/default.htm). If
r> you download the Windows 3.1 self-extracting archives and rename
r> them with the zip extender, they extract just fine with STZIP
r> (but not the Win95 archives). You might want to grab Arial Black
r> for headings. After trying many of the fonts there, I'm sticking
r> with Arial and Courier.

Thanks for the suggestion. I looked at that page, but didn't download
anything because of the self-extracting archives. (I thought they might be
unzipable, but I didn't feel like bothering.) I'll check it out again.

Thanks for taking the time to check out those web pages for me!

I knew there had been attempts to create a 68000 version, but was only
aware that they were working on it. From what I could gather it, it was
more problems with the memory management facilties in the different
chips rather that than the co-proc. causing the problems.

> 1. whether "Thats Write" is still being supported?

Unfortunately not, the no-programmers gave up and changed to OS/2 (I don't know whether they are still in that niche).
But you missed three versions of TWrite!
The last one was TWrite 4.12 and this one supports HP Laserjet 5P.

> 2. what the format of the information is that is to be supplied to the
> program which produces the printer font files?

:-(
Never tried this, sorry! But TWrite 3 and 4 anyway work with vector fonts (and the old ones).

> 3. whether such printer font files for the HP Laser Jet are available
> either commercially or in the public domain?

I've got a HP LJ 5MP and it works quite fine with TWrite 4.12 and TWrite 4.11 Postscript.
I would upgrade the soft!

I went to AMS about 3 years ago, and thought it was quite good. There was what they called the "Atari forum" which was a set of stalls set up along one of the walls, and I remember that one PC company was selling SONY 17" SVGA monitors for a ridiculously low price - I would've got one, but they sold out :-(Still, it's well worth going, if anyone's considering it.

Hi Oliver, it is not quite clear to me whether the Amiga has filled
polygon capability or not. Can you shine your light on this subject?

That's the whole idea. If as many Atari users as possible turn up, it will encourage us and the organisers and the Atari dealers to make the effort to do another show. If we only get a few people coming, then that will be tragedy.

But I reckon there's going to be a really good turnout, so let's just make it a really, really good turnout!

Kind regards

Take a look at the source for these pages. You might find the page author
has specified a particular font in the html code.

I looked at the source html, and even mentioned that fact above. As far
as I can see, CAB has trouble with this page regarding what fonts to use.
Typewriter <tt> (hence Courier for Terry and I) is specified only in
certain areas, but CAB uses that style throughout the entire document.
Maybe it's more the html's fault than CAB itself (whose validator reports
errors). The source looks like it was created with a Web authoring
frontend, and then someone went in and changed a few things 'by hand',
forgetting to close a few tags.

1207. Nova Software Compatibility

Newsgroup: comp.sys.atari.st
Date: 1998-06-23 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <6mp26f$c60@news.Hawaii.Edu>
Source record: 98513

Greetings,

I just crammed a Nova VME adapter into my TT. Does anyone out
there use a Nova? I'm looking for hints regarding software compatibility,
and recommended software.

So far, in 24bit color, I have crashes occurring if I try to run
ImageCopy 4 and then attempt a slideshow, image convert, or submenu.
TrueImage won't work in 24bit color, and my monitor displays colors all
funky in 15 and 16bit color. In 15bit color TrueImage is SLOW! It must
take a minute or two to draw a 640x480 screen. TruePaint doesn't display
properly in anything as of yet.

Any recommendations would be greatly appreciated. I would like to
know what color depths are recommended, and what graphics related and
other programs will take advantage of a Nova properly.

Cheers!

Aloha,
John Perez - jperez@hawaii.edu

X-Newsreader: NEWSie Version 0.88 (Atari)

Hello People,
Earlier this evening I downloaded the above and could not figure out why I couldn't get to any of the URLs. When I checked the modules folder there was no CAB.OVL !
After I added the one I'd been using with CAB 1.5 it worked just fine ....

Just a hint for anyone who hasn't tried it yet !!

ATB

Jim.

PS I'm so impressed with this version that I'm buying it as soon as I can find a link to Systems Solutions page that works !!

Are you sure its a 20" monitor? What is the model number on the monitor
and what system is it designed to work with?

I am not familiar with any 20" Atari monitors that were ever marketed. The
closest thing I can think of was Atari's TTM194 or TTM195, which were 19"
monitors designed to work with the TT030 systems.

>for writing texts.

No problem! With TEMPUS you can use differnt keyboards!
You need to edit original Keyboard Installation file (KEYSYS.INS)
accordingly to your needs. Function keys and hot keys are to be defined
also.
Next step is to load this file and click in menu:
Parameters->Compile setting. That's all.
If you have some different *.INS files, you can change keyboards.

From: phantomm@kih.net
Message-ID: <6mp63aicc1@dbtsvr2.dbtech.net>
Source record: 98521

Greetings,

I am looking for a fast way to merge over 500 small text files into one large text file.

With the large number of text files it would be very time consuming to merge one after another using a text editor.

There is probably a easy way to do this but I haven't found a fast way.

So if anyone knows a program or a way to do this using wildcards or such on a Atari Falcon then I would appreciate any help.

Thanks,
*If you post a reply to this article, e-mail me your reply also.

I've found 15-bit mode to be the most compatible for my needs. Some applications won't work in 16-bit mode (like Cranach and Imagecopy). Imagecopy works fine in 15-and 24-bit modes; TruePaint works fine only in 256-color mode. GrafTool, GEM-View and CAB, for instance, work fine in every mode.

Any program with good VDI code should work with the NOVA. Since you haven't got TruePaint or Imagecopy running correctly on it, I can assume something is wrong at your end.

I have the latest copy of Linux and MinixFS. I guess you have to
learn Unix to use it. I afraid to try to use the Minix for a
partition because I don't want it to wipe out a my hard drive. I have
a lot of stuff on it that isn't fully backed up. The X-Windows port
for the F030 supposedly only works in mono. People wonder why Win9x
is so popular-it's because there are no legitimate easy to install
alternatives. Don't get me wrong I don't like windows, but my F030 is
slowly becoming obsolete. I don't like when I come accross file
formats that I can't use...ie... Real Audio, MP3, among others.
Getting Linux up and running should be a big boost to extending the
usefulness of my Falcon. Now where are those PPC 500 mhz
accelerators.......

No, from the look of their web pages I wouldn't want to be involved
with them, even if I could be bothered to give up my time to
contributing to a web site with a readership of about 2.

t> Are you sure you know the difference between a JPEG and a GIF?

Quite sure.

t> Standard JPEG does not support animation.

That's what I thought, which is why I started this thread. I don't understand what's happening on these JPEGs. Perhaps they're inadvertantly playing tricks with my interlace display, but it just seems weird that it's only happening to specific body parts and not the rest of the pic.

t> If the file you are thinking of shows animation in any popular
t> Web browser then I feel safe in betting lunch that it's a GIF.

They do the same thing in the various JPEG viewers I use. These viewers couldn't display a GIF if I wanted them to.

r> Did you install the Microsoft version of Courier or the Bitstream
r> version (spd_font.zip from Martin-Eric's download page)? I'm
r> using the Bitstream version with Geneva and NVDI 3.02.

Are you sure you're using a Bitstream version of Courier? SPD_FONT.ZIP doesn't come with Courier. It only comes with Dutch and Swiss fonts.

I've deducted that there is definitely a problem with my Courier TT font. Either the font is bad or there is some incompatibility with my version of NVDI. The words even run together in the font selector example (i.e. "thebrownfox"). And all four versions of the font do the very same thing. If I use another font, such as Monaco, the spacing problems disappear, as does the problems with those popup buttons that I was having.

I re-downloaded the TTF archive and reinstalled the Courier fonts, but still, the very same thing. So I guess I'm on the lookout for another version of a Courier font (or suitable replacement). Any suggestions?

Not surprising. The last docs I saw were for v1.95. Not sure where I got
it, but probably some link from either ASH or the nbp page.

d> What I find odd is that the "Settings" button that WDialog adds to
d> the print dialogue in CAB appears to have many settings greyed out -

I get stuff greyed out too, but not the range of pages option. Click on the
'Frm' radio button first and it comes up. I assume the greyed out features
aren't available on my printer...

Me actually, but who's counting...

A quick repost for Edward's benefit...

From: Harry Sideras
To : thechyld@pcc-uky.campus.mci.net
---------[COMP.SYS.ATARI.ST]---
t> So what does Wdialog do, and when do you need it? I've got it in my
t> auto folder as well... Thanks! ;-)

Paraphrasing from the docs:

WDialog is a complete library of functions that can be incorporated into any
TOS version. It provides windowed dialogs, popups, checkboxes, listboxes,
radio buttons etc. Using it means you don't have to rely on the programmer
coding his own versions, which may be incomplete or failing in functionality.
Using a system library also means that program sizes can be reduced, because
the programmer doesn't have to assume the user only has the functionality of
the lowest TOS version and build from there.

Features of this extension are:

Compact, resident extension makes use of frequently needed routines:
window dialogs, listboxes, font selector, print dialog.

High flexibility in the routines; i.e. no static limitations in the
number of dialogs or simultaneously open font selectors; list boxes,
that can manage more than just text-objects, multiple selection, auto-
scrolling, etc.

Features and extensions of the OS will be used (3D effects, Clipboard in
edit fields, ...).

Extended object types (Gruppenrahmen, radio buttons, etc.) assumed to be
available, so that the RSC-File remains compact.

In older OS-versions missing object types will automatically be
generated through a short routine (-ADAPTRSC.C).

Design of the program interface should to the "Personality" of the OS
pass (no "Dino-Tuning" with 3D-effects under TOS 1.0).

The result of this is WDIALOG: A System extension, that makes available MagiC compatible AES-extensions.

The only missing element in Magic 5 that is added by WDialog is the addition of the print dialogs, which are used in programs like Texel and CAB.

HTH

>> and Selectric.
c>
c> This is not clear! D'you mean UIS III _is_ or _isn't_ compatible with
c> MagiC? My experience is that it definitely is NOT. I wish it were.

Based on reports I've heard there have been problems with every file selector
and MagiC - Freedom v1.15 and Selectric included. However, UIS will work
quite well within its limitations (ie not supporting the newer calls etc).

Assuming you don't use an alternative desktop, Put the following in MAGX.INF :

#_AUT C:\UIS_III.PRG

This will auto-start UIS after Magic has been installed, because it won't
work from the Auto or Auto/Apps folders.

If you do use an alternate desktop that yses the #_AUT line, just run UIS
from the desktop and it'll install ok.

The RAM where? I've 36 MBytes, and even with an 8 MByte cache on CAB,
Mint, etc.... I've still got 22 MBytes for Newsie to put the full newgroup.
Anyway you can up Newsie's limit, or modify the download algorithm?

c>
c> Hi Terry,
c>
c> Are you sure about that DNS defaults?

Absolutely. Both my CLIENT_IP and NAMESERVER addresses are set to 0.0.0.0,
both in DEFAULT.CFG and DIAL.SCR (where applicable).

c> Those I've setup with PAP (no dial script) won't work with
c> NAMESERVER = 0.0.0.0 in the dial.scr and default files. Most ISP's
c> will give you their DNS numbers. What I mean by don't work is that
c> CAB won't resolve anything because STinG see's DNS as 0.0.0.0.

I can only guess that it's not working because those ISPs are not using
dynamic addresses. Mine does. So STinG (and PPP-Connect) negotiates my
ISP's address each time I call.

The only drawback (if it is a drawback) is if I edit my config with the
Dialer, it saves my last negotiated address, instead of leaving it at
0.0.0.0. It still works after that, but I'm not sure it's negotiating a new
address each time after that, like it's supposed to.

c> I have two ISP's, but both require dial scripts, so DNS numbers
c> are needed. I haven't checked this out in a while, so if some
c> ISP's using PAP will negotiate DNS numbers also with STinG is a
c> plus. I just haven't run into any yet.

Obviously, I'm not using dial scripts, either. Yeah, it's certainly a plus.
That's actually probably built into the PAP standard. I was a bit concerned
when my ISP told me they use dynamic addresses, but as it turned out, both
STinG and PPP-Connect handled that, so we're in good shape there.

Is there such thing as an animated JPEG? I have several JPEGs where part of the picture moves as if it's animated, while the rest of the pic is perfectly motionless. For example, a person's arms might be moving, while the rest of him and the rest of the pic does not move. And the pics display the same, no matter what viewer is used.

Can you format floppies on the TOS desktop ? If not, then the drive
might be dead or the cable to the drive might have bad connection.

Also, are you sure you are using the correct format with the correct
drive. A single-sided drive will definitely have problems reading double
sided disks. What type of ST is it, and what kind of drive do you have ?

Cheers,
Nick

You can use the sound.cpx that's included with the XControl package, as it has balace and tone controls for STE sound. However there is no reason for the balance to be set to full left after a clean boot.

It sounds more like there is a bad connection with your cables. If your speakers are PC speakers, then they probably have a mini-jack that you are connecting to a "2xRCA to mini jack" adapter. Maybe something is wrong with this adapter, or the jack isn't making a full connection.

Cheers,
Nick

Linux is a version of the Unix operating system. It is free, though some companies make a living from selling it. Originally just thought as a home version of Unix, more organisations are using it now, and have managed to get some major software packages released for it. These include packages such as MATLAB which is heavily used for mathematic based research.

As such Linux does not have a GUI, but X is usually supplied to provide this - in addition, most modern copies of linux add a front-end to X which is similar to the Win '95 interface.

Given most unix systems use an i-node file system, I would guess that is how the MinixFS works. I seem to remember covering this in an OS class, and the Minix source was included in the textbook.

Only having an ST at home, I can't yet run Linux, but there should be a version available for the Falcon and TT (possibly).

Hello Levien,

l> Hmm, you might be right about the polygons, I don't know...
l> But still, 3D graphics have to be translated to 2D graphics before
display
l> (CPU work, faster on Atari) and then displayed (line drawing could be
l> faster on Amiga).
You are right for wireframe vector graphics. But that's not the sort of
graphics we're talking about, or? ;-)

If you think, filled polygons are drawn line by line (after calculating
the
lines), you are wrong. The program has to calculate the edges and the
hardware has to fill it. *This* (the filling) is the step, where hardware
can
accelerate the 3D drawing. But the blitter doesn't. The blitter makes the

drawing of single lines faster (and the "transport" of rectangles within
the
memory/screen). But if I don't tell the blitter to draw single lines (and
I
don't do that at filled polygons, because the CPU should have to calculate

the starting and the ending points before - which would consume much more

time), there is no acceleration at all.

Gruß, Oliver

I'm not sure what you mean here ('as if it's animated'), but just
thinking out loud, one could create a similar effect with, let's say, a
jpeg for the motionless part, and then separate animated gifs for the
parts that move. The html could be written so that these separate
graphics 'butt up' to each other, creating the look of a complete graphic.

This page looked fine in 2.5 and 2.7, with and without wdialog. Any chance the Courier font got corrupted in some way? What's funny, though, is that I have Courier installed for preformatted text, yet it's used as the body text on this page. Judging by the source html, CAB should have used Arial (normal text) instead. It's almost like CAB decided to overrule my font settings. Whatever the case, the page formats correctly.

This page looked fine, too. Courier is used again, this time in the menu buttons. Did you install the Microsoft version of Courier or the Bitstream version (spd_font.zip from Martin-Eric's download page)? I'm using the Bitstream version with Geneva and NVDI 3.02.

BTW, I tried some more of those free Monotype Web fonts from Microsoft's site (http://www.eu.microsoft.com/typography/fontpack/default.htm). If you download the Windows 3.1 self-extracting archives and rename them with the zip extender, they extract just fine with STZIP (but not the Win95 archives). You might want to grab Arial Black for headings. After trying many of the fonts there, I'm sticking with Arial and Courier.

>Anyway you can up Newsie's limit, or modify the download algorithm?

I suffer something similar here. I have downloaded the full groups listing from my ISP (CiX) on four occasions now. The 1.2 Mb download goes fine, then the sort begins, then there's some messages showing percentages being written to disk then the crash occurs. This is repeatable every time. I've used a bare system with only HSModem and NEWSie running, but every time I've been left with these following sized files:

H:\NEWSIE88\

FULLGRP.IDX 232
FULLGRP.TXT 616.658

I guess this is about only half the groups available from my ISP. Certainly the full group file only goes from:

3b.config

to

clari.world.americas.canada.briefs

If I try to GET NEW GROUPS and use EXISTING option in NEWSie I get a blank newsgroup list screen then an 68000 error #69 message under MagiC.

I've tried twice to download the listing under single TOS with only the comms stuff like HSModem running and I get a similar result.

System is a 14Mb Falcon BTW. And I've always got something like 10 Mb free.

I have a dim recollection that about a year ago using an earlier version of NEWSie I did get a full newsgroup listing without problems, but it was with Zetnet ISP, and it was about 700K in size. I remember trying to get a Zetnet listing with a later version of NEWSie and that failed, so I don't think it's an ISP problem. The actual download goes fine, it's always when the sorting and writing starts. It wouldn't be so bad if the orginal download file was intact because I could use that as a reference, but it appears to me that the sorting and writing and subsequent crash overwrite this original file or something - am I correct?

It's a downer really, because I haven't got a clue about what NG's my ISP take :-(

Kind regards
Mike Kerslake

Low coverage, only amiga, Psion and CHRP, broken links all over the
place, pictures that download as binary text files instead of images,
poor, poor, poor. No coverage of Linux, on intel or Alpha, this is
probably the most talked about non-MS OS at the moment.

I presume, then, that you have contacted Convergence and offered to help
them to increase their Linux coverage?

Just a thought.

Keith.

Linux, is a Free (GNU licence http://www.gnu.org/) Unix-like operating
system. It runs on many hardware x86, Alpha, Atari, Amiga, Mac, Bebox, Acorn.
Basicelly it is a Unix (with lots of posix stuff in it). To have a gui you
need to run X-windows (which demands more then 4Mb of memory). It uses its
own file format ext2fs. for more info take a look at :

1267. Thats Write printer fonts

Newsgroup: comp.sys.atari.st
Date: 1998-06-23 00:00:00 UTC
From: s322580@student.uq.edu.au
Message-ID: <s322580-2306982359310001@s322580.student.uq.edu.au>
Source record: 98692

Help!

Several years ago I purchased "Thats Write" (Version 1) from Compo in UK.
I believe that Compo has since folded.

Recently I upgraded to a LaserJet 5L printer. I would like to be able to
use the built in printer fonts from Thats Write. With the original
distribution disks there was a program that was not documented that would
apparently produce the printer font files (the ones starting with an "X")
based on information supplied.

Does anyone know

1. whether "Thats Write" is still being supported?

2. what the format of the information is that is to be supplied to the
program which produces the printer font files?

3. whether such printer font files for the HP Laser Jet are available
either commercially or in the public domain?

Thank you for your help.

Eric Kopittke

Brisbane, Australia.

Sort of. I'm only familiar with two alternate desktops, Magxdesk and Ease. Both will display pics in high color modes, but the pic itself cannot be in high-color; it needs to be no greater than 256 colors.

From: jperez@Hawaii.Edu
Message-ID: <6mpgal$kn7@news.Hawaii.Edu>
Source record: 98538

Greetings,

I'm looking for the best image editor that is compatible with the
Nova Mach64 cards, 24bit color, and includes a cloning-type tool.

The programs that I am aware of currently (some not readily
available or not in English) are:

Photoline
Positive Image
Papillon
DA's Picture
Smurf

Any recommendations, pros/cons, and comments regarding filters and
operating speed are greatly appreciated.

Aloha,
John Perez - jperez@hawaii.edu

outrider@lvdi.net (Terry May) writes:
> Is there such thing as an animated JPEG? I have several JPEGs where part of
> the picture moves as if it's animated, while the rest of the pic is perfectly
> motionless.

Are you sure you know the difference between a JPEG and a GIF?

Standard JPEG does not support animation. (Nor does progressive JPEG,
contrary to another followup to this thread.) If you work in video
editing you will see "M-JPEG" files, which are just sequences of
JPEG-coded video frames ... but they aren't standardized or widely
supported.

If the file you are thinking of shows animation in any popular Web browser
then I feel safe in betting lunch that it's a GIF.

Well I havn't realy used any of them. I have used Papillion a bit but it
was the old version which only supported 256 colours. It's okey for simpler
tasks. I would guess PhotoLine is the one to go for as it's very powerfull
and takes full use of the Nova card. Also if you contact ComputerInsel
directly you will get a deal you can't refuse. PhotoLine looks and feels
alot like PhotoShop.

Hi all,

The following for sale, price incudes P&P in UK. Would consider swop for 2.5" hard drive.

ATARI 520 STFM, Marpet ram upgrade fitted, 2mb onboard. + mouse, joystick, cables & 25 disks of PD software. = 35 pounds.

ALPHADATA Real Time Clock, uses cart port (has pass through port) + software. = 6 pounds.

VORTEX PLUS 20 external cased hard drive, all leads and software to connect to STFM/E. Heavy, metal cased, ideal for placing monitor on or squashing irritating children. Full of PD software. = 30 pounds (20 if you collect!).

STEREO SPEAKERS, batts or 9v dc input. Volume control, bass&treble switches. = 7 pounds.

Atari Software, all original items, 2 pounds each, P&P 50p extra per item.

ZOOL
C.O.T.U.S.
PC DITTO
ELITE
JINXTER
MACH 3
STAR TREK (REBEL UNIVERSE)

> Did you check to make sure there wasn't some sort of body style that was
> cascading back to an earlier page or a site style sheet?

A good point, but no, there was nothing like that in there.

To prove it to myself, I just ran WebTech's validator on the page that
started all this. It's riddled with bad html, plain and simple. Two of
the many errors were these:

- end tag for "TT" omitted, but its declaration does not permit this
- end tag for element "TT" which is not open

That's why the entire page used a typewriter font -- CAB wasn't told when
to stop using it.

Yes, I'm sure: The archive spd_font.zip also contains Courier, which is
the one I'm using. The filenames are bt223008.spd, bt223009.spd,
bt223010.spd, and bt223011.spd. Install them and things will be fine.

I fully expected someone to write this, in fact I originally was going
to post a refutation of it in my first post, but decided I'd see if it
was justified or not. If I'm to help out with something, I need to
think that it's worth helping, I don't think that site is worth
helping. I've already got enough on my plate with work and messing
around with my system, I post enough answers to the linux groups to
feel that I'm being constructive. I spend about 1.5/2 hours per day
posting answers to people's questions, and ask about 1 question per
month if that. I'm not prepared to cut down on this or anything else
to help out with a site that's not showing any signs of being useful
or well maintained.

1289. Question about ST and Modem

Newsgroup: comp.sys.atari.st
Date: 1998-06-24 00:00:00 UTC
From: ugg1@rzstud1.rz.uni-karlsruhe.de
Message-ID: <6mqkd4oid1@nz12.rz.uni-karlsruhe.de>
Source record: 98556

Hi!
Does anybody know, if the RS232-port of the Atari ST is standardized or do I have to make/buy a special cable? If so, would you explain to an idiot in electronics, how to make it.

Thanx.

1290. Looking for a SCSI HardDrive (small capacity)

Newsgroup: comp.sys.atari.st
Date: 1998-06-24 00:00:00 UTC
From: "david.guillen" <david.guillen@skwbio.com>
Message-ID: <01bd9f64$8eebb580$9dc969c1@mtf7inn201>
Source record: 98557

Hi there,

I'm looking for a brand new (or a recent second-hand) SCSI External hard drive (small capacity) to plug in my current configuration : AtariSTE1040, 4Mb Ram, 200 Mb HardDrive. The SCSI interface is an ICD one. The idea is to be able to boot on both drive and to backup the first one onto the second (fed up with floppies).
I'm leaving near Nizza (France), send me your offers.

Thanks,

david.guillen@skwbio.com

Erm... It's standard. You can connect any PC Modem or a null-modem cable
for file transfer.

Cheers,
Nick

1294. Re: Atari and Amiga Users Unite?

Newsgroup: comp.sys.atari.st
Date: 1998-06-24 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199806240000.a59836@lu.maus.de>
Source record: 98561

Hello Hans,

mn> Hi Oliver, it is not quite clear to me whether the Amiga has filled
mn> polygon capability or not. Can you shine your light on this subject?
I'm not sure, what you mean.

Of course the Amiga can handle filled polygons (I suppose most computer
with
standard graphical output can handle that/do have system calls for that).

But the blitter is accelerating the output of lines and rectangles (nice
for
scrolling/shifting blocks and the redrawing of windows and other desktop
stuff), whereas polygons for vector graphics usually don't have that
shape.

So you tell the system to draw a filled polygon by giving the points of
the
edges and if the system has hardware to accelerate that sort of output
(the
starting and the ending point of each line is *different* and has to be
calculated by the system, whereas a 3D acceleration does this
calculation
within it's special processor - the system has nothing to do with that,
nothing to calculate by itself), it is faster than a system which doesn't

have this type of acceleration. The programmer and/or the CPU has nothing

"special" to do, the effect will happen everytime with every game (as long
as
you don't use your own output library, but even then, you would/should use

the hardware of the system - at least, you just have to watch, how the
system
itself uses the hardware).

Once again: "Accelerating 3D" has nothing to do with "accelerating 2D".
The
difference of the time needed by the processor to calculate the 3D output

(floating point arithmetics) is *so* big, that you can't see/feel any
faster
drawing of single lines.

PS: To accelerate floating point calculation you can use:
1. a faster CPU (which does the calculations faster than a slower one)
2. a FPU (which does the calculation instead of the CPU)

3. tables with precalculated values (no or less floating point
calculations
by a system without a FPU, the values are just pulled out from that table)

The first one is what we are talking about, the last one is a trick used
by
coders to got faster movement of objects (or "3D" output? But that would
be a
very large table ;-), which look "real-time calculated", but in fact it
isn't.

Greetings, Oliver

THE COMPUTER DUNGEON is beginning the process of moving to a new location and is having its first (and hopefully last) MOVING SALE.

From now until August 1st, you can take 20% off the listed price of in stock inventory items that include ST/Falcon software, ST/Falcon accessories, Lynx-Jaguar-2600-5200-7800 systems-accessories-cartridges, and more.
NOTE: Shareware games, seleted hardware items, and magazines are excluded from the discount.

AND.... if your order totals $75.00 or more, you take an additional 5% off your

order, making your total discount 25%!

Just visit our website, select the item/s you want, give us a call to place your
order, and we'll take 20% to 25% off the price! You save money, we save our backs!

Visit our website at: http://www.mcs.net/~isis/dungeon/dungeon.htm
or call 708-547-7085 10am to 5pm CST Monday - Friday.

We also have Atari Computing #9 and ST Plus Fanzine #29 in stock!

Thanks for taking the time to read this and we look forward to helping you with all your Atari needs.

Al Horton
The Computer Dungeon

Hmm...depends on what you define as "high-color". I'm using NeoDesk4 and
Geneva with a 256 color .BMP pic from Babylon 5 that works pretty good.
(its a pic of a Star Fury firing downwards towards a planet). Do you have
it set to use all the pics colors or all but system?

It's standard and you can usually buy a made-up cable for less than
the price of the components.

Just look at the lablel! There are 'normal' cables for connection to
modem/printer and there are 'null-modem' cables (with two connections
swapped) for con`mputer->computer connection.

Hello Everyone.
Recently I downloaded the above from somewhere, managed to lose it before having a good look through it, and now can't remember where I got it originally !!
The contents of the Zip were in the form of 16/17 .DOC files which seemed to cover every aspect of SCSI and some of these were quite large.

Anyone know where I can go to get this file again ?

TIA

Jim.

PS Thanks for the replies to my earlier question about the System Solutions link.

Sorry, bad explanation on my half, Eric Hays has said what I meant to be
saying :-)

But the omitted closure of few tags sounds quite likely. I've lost count of
the number of times I have ended up with centred text throughout a
document, because I've forgotten to go back far enough to close a heading
off!

Kind regards
Mike Kerslake

Any particular reason? It's easy to subscribe via SFT and one or two other
Atari dealers in the states take it as well. If you want more details, just
ask, I'll be happy to help.

>Thanks also to you for the URL.

You're welcome, it's an excellent program and Mark is busy right now with a
new version which will be even better :-)))

Kind regards
Mike Kerslake

>Mike, your doing a goodjob of getting people to subscribe; keep it up :-)

:-)

But the serious side is that as long as we have a reasonable number of subscribers we can cover the costs of the magazine. Even though the publishing company jointly directed by myself and Joe Connor is commercial, actually doing the magazine in today's Atari market is not really viable from a commercial POV. We just do it on a cover the costs basis, but as a business we have to make sure we don't lose money. Therefore every single subscriber is important to us!

It's a sad fact that if we and other Atari magazines don't get support we can't survive, and a more than likely consequence of this will be a real downturn in the Atari market as a whole. Printed magazines keep the whole scene together whether they are in English or French or German or Spanish.

The good thing is that as long as our subscription figures stay as they are we're okay for quite a while longer :-)

Kind regards
Mike Kerslake

Hi Steve,

VFAT works fine I have been using it on two partitions since my MaciC
5.11 update last year with no problems never lost a file. MagiC 5.10
had a minor problem with VFAT solved in the later release. My system
is TT 4x4 MaciC 5.11 NVDI 4.119r HDDRIVER 7.13

I'm not sure, but I don't think NEWSie supports the use of user and password to connect to a news server. This would be via the AUTHINFO command which is required by some news servers. You could use NEWSwatch to collect and send your news because that does support AUTHINFO (as of v2.00). Trouble is, you can't use NEWSie with NEWSwatch. You'd have to use Okami or Oasis2 instead.

I recently bought a Syquest EZflyer 230 for $129 $US dollars. That
was a CompUsa, but you should be able to mail order for similiar
prices. This is a speedy little bugger and will be as fast as the
STe's hard drive port will. In addition it's removable, and
cartridges are only $25 USD.

N/A

5.) Giving the current situtation of the ST platform, what are your
feeling of copying commerical software and distrubuting over the Internet?
(Legalities are well noted, just your honest feelings about it)

Old games should be put into the PD, so that old hardware still could
be used. Just on the basis that any company who puts their old
versions of games in the PD will probably gain new customers for new
games on either more advanced machines, or other platforms.

6.) Would you like to see ST emulators play more games?
in an ideal world... ...it's not a priority for me (see above).

Yes, I think the emulators have given the Atari platform a second
life.

7.) Do you plan on getting a Hades or Milan type machine in the future?

Yes, providing it is compatible with my old software, and especially
if it has a true STe mode. Using the STe emulators on my F030 are a
pain in the *&%.

8.) If you have a high end machine, would you like to continue to play
your favorite ST games on them if it was possible? (Not only includes 040
but also latest PC running ST emulator)

Yes.

I get confused with 'user name' etc but in Personal Information (under Preferences) I put my ordinary name under Full Name, I leave Account Name blank and I fill in my e-mail address in the appropriate place.

In Mail Reading Options (also under Preferences) I elect to save my password, and I type the password in the space provided. I presume that if I do not save the password that I have to type it in every time I want to access my e-mail.

Mr Maddog (mrmaddog@microserve.net) wrote:
: 1.) Do you still use any TOS platform computer?

Yes - ST, TT, and Falcon

: 2.) Do you use a PC, and if so which Atari emulator if any?

Yes - I manage over 160 PCs at work, and have one on my desk, with a Gemulator card of course. I use this for application software and file management only.

: 3.) Do you still play ST games, even occasionally?

Yes. I'm planning to play Chaos Strikes Back again soon since PC games like Battlespire and Daggerfal have proved so lousy.

: 4.) Assuming you can play a certain game on PacfiST, you would want to
: make a backup copy yourself for playing it on the emulator or look for
: it on the Internet? (Hypothically speaking, you are able to make a image
: to be used on PacfiST)

I'm not sure what this is asking exactly, but I certainly believe that people have the right to backup their own games or to obtain replacements for failed disks that have been legitimately purchased.

: 5.) Giving the current situtation of the ST platform, what are your
: feeling of copying commerical software and distrubuting over the Internet?
: (Legalities are well noted, just your honest feelings about it)

Software that is not for sale anywhere should be released as freeware by the author/publisher. It is a shame that much of it just disappears forever even when people like me are holding out my cash and asking for someone to please sell it to me. Examples of these are Emagic Sounddiver 2 ST, Steinberg Wavestation sound editor, InShape II renderer, and DA's Picture. It is illegal to copy these programs, but I'm not sure that it's wrong.

(Begin digression)

I strongly believe that copy protection has played a part in killing the Atari software market. Myself and my friends that were Atari users stopped buying ST games largely because many of them did not function properly due to heavy disk protection. After spending about $500 on games that I couldn't play, I stopped buying new games for the ST, and bought them for PC instead. Also, only a very small handful of games were hard disk installable, while the exact same games were released for PC and were hard disk installable. The difference? On disk copy protection. Then

they got ridiculous, with disk protection, code wheels, in manual protection - usually more than one at a time. After all, the last thing that I want to be doing in the middle of a game is hunting through a manual and counting words (see Frontier).

Serious software suffers tremendously as well. I own C-Lab Notator/Emagic Logic MIDI sequencers, and have consistently had difficulty with the cartridge dongle/Log3 Interface. I have lost many songs as a result of the programs constantly checking for the dongle, and frequent failure to notice that it's there. A friend of mine cannot use his Logic/Log3 because his TT refuses to see the interface. We're talking about $500 programs here. Another problematic application is Chronos 3D, where the dongle interferes with port operation. I personally chose not to purchase Le Redacteur Word Processor because it asks you to type in words from the manual as copy protection! I'm hesitant to purchase programs like Zero-X and CD-Recorder Pro specifically because they have dongles, and I'm not the only one.

(End digression)

My griping aside, I believe that software that is available for purchase should be paid for. The rest of the software that cannot be found anywhere really should be preserved somehow, and if someone can benefit from using it then I'm not sure why anyone would be upset by this.

Fortunately, some companies such as Best Electronics, B&C Computervisions, Chromagic, Systems for Tomorrow, Keith's, Computer Dungeon, and more are keeping stocks of Atari software (and games!) so I think it's best to support them whenever possible.

: 6.) Would you like to see ST emulators play more games?

I wouldn't mind if the emulators were more stable, but I have not found them to be as such, which makes for an unsatisfying game experience.

: 7.) Do you plan on getting a Hades or Milan type machine in the future?

Only if it has a cartridge port. I'm not tossing my multi-thousand dollar investment in cartridge dongle protected software into the trash quite yet. The Wizztronics computer is intended to include a cartridge port!

: 8.) If you have a high end machine, would you like to continue to play
: your favorite ST games on them if it was possible? (Not only includes 040
: but also latest PC running ST emulator)

I would love to be able to play my ST games on my Falcon, TT, or Afterburner.

: Remeber, your honest answers are most welcome...they may help me get a
: better idea on what the ST community would like. As always, thank you
: so much for your time :)

Cheers!

If the Newsfeed requires a separate password, there is no place in
Newsie to put it. I had a similar problem with my ISP about a year ago -
they changed Newsfeeds to one that required a separate log on password
and I was SOOL. Fortuneatly, they had a lot of problems and went to
SuperNews which does not require a password. You might try one of public
newsfeeds that Eric had posted.

I recently (as in today) added an Atari ST to my collection. The
configuration I got is as follows

o Atari 1040STf with mouse
o SC1224 color monitor

It is not much, I agree. Before we talk about anything else, can anyone
explain me *what* I have and *what* I can do with it as far as expansion
possibilities? Like, how much memory can i put in it and ho whard would
it be to add a hard drive/SCSI interface to it?

Mauricio-

As far as I know the 1040STF is a 1 meg machine. There is a 'kit' that
was put out by a UK company way back when that would increase the meg count
to 4, but this involved soldiering and was pricey. You are better off, price
wise, buying a good used Atari that already has 4 megs or more, i.e., STE,
Mega, TT or Falcon.
The DMA port on your 1040 STF will support a SCSI interface which inturn
allows you to hook up a SCSI hard drive and/or CD drive.
There are other expansion options but, IMHO, buy a machine that already
has the features you want as opposed to upgrading a 1040 STF.
My 2 cents for the day.......

Actually, you were the first with the correct answer! Thank you so much. It was Metrocross - I had to hear the name to remember. I don't know that it was a museum but it looked like one with the pictures on the wall.

> The floor was a sort of checkerboard and stuff like cans would roll into
> you.

That's it alright. The chekerboard floor pattern made it visual appealing and it ran so quickly on the ST. It wasn't the greatest game ever made but it sure appealed to me. It was right up there with Joust.

> Time Bandits, was that by Microdeal?

That's the one. It was a dandy game...

Hi Terry,

same with Thing and Jinnee, I've gotta go look into the docs again to know precisely what they support, but I recall Thing and Jinnee support IMG formats to up to 256 colors. Once I loaded a 24 bit IMG format into Thing and it crashed... I recall the IMG came from Graftool and was something like 800 kB...
I used to have Thing display a 256 color IMG, but it takes time to "set" the desktop everytime and also consumes lotsa RAM... so now it just shows a desktop in dark grey color.

1339. Taskbar 2

Newsgroup: comp.sys.atari.st
Date: 1998-06-25 00:00:00 UTC
From: joes@chem.sintef.no
Message-ID: <3591f799.230562271@news.sintef.no>
Source record: 98408

Taskbar 2 is now finally released, you can find it on my homepage (see sig.). Compared to Taskbar 1.2 (the last official release) there's been a lot of changes:

* Has it's own, built-in start-menu. The menu is built from Thing group-files, which means that there's no need to edit text-files manually.
* DHST-server.
* Separate configuration-program.
* Configurable hotkeys (needs Clocky).
* Can autostart-applications.
* Works perfectly with memory-protection and in a multiuser AES-environment.
* Heaps of minor changes and bugfixes.

Taskbar 2 is still beer-ware and N.AES only.

For more info and some screenshots, see in the Atari-section on my homepage.

You need a little stereo mixer for this (if you want to hear both at the
same time), or a little switchbox. You can get cheap ones from most
electronics sources.

Cheers,
Nick

Properly configured Thing will cache the transformed image so it's only transformed once. Check the Thing documentation under "thingimg.ovl" (or something like that).

>

An STF is more or less stuck with it's original memory (1Mb in your
case), unless you install a memory expansion board that will allow you
to put 30pin SIMMs.

A hard drive will be more or less plug and play, BUT you need:
-SCSI Adapter (from an Atari dealer)
-SCSI Hard drive (any type will do)
or
-An old Megafile drive (but you'll be stuck with an old and slow, and
low capacity drive).

If you want it for games, none of the above is needed. However, if you
plan to use your Atari for serious stuff, then you will NEED a
monochrome monitor. Most serious programs won't run on a colour screen,
and modern stuff often requires at least 640x400.

Check out the Quick FAQ for details.

Not sure from your email address where you live, so it's hard to
recommend a source for upgrade parts.

Cheers,
Nick

Dead slow; but to be fair in my tests so far I was
1. running javac from a shell prompt, so I was starting up a JVM just
to run javac.
2. using a zipped version of the class libraries: it would probably
run faster if I unxipped'em.

I've since transferred the hard disk to a TT, and hope to return to my
explorations using that.

Have a look at Digital Lab that use the M&E system. It's shareware (300
FF, about 50 $) and a demo version is available at:

http://perso.club-internet.fr/f_bayle/download.htm

If you don't have it already, you'll need to fetch the freeware Parx.sys
(the M&E modules), available on the same page.

8-)

> So if anyone knows a program or a way to do this using wildcards or
> such on a Atari Falcon then I would appreciate any help.

It is simple... run mupfel and wrote

```
cd sourcedir
cat * >>destdir\xxx.txt
```

or if you have them in recursive directories:

```
cat `find -type f *` >>destdir\xxx.txt
```

is it enough?

As you can see, you should find out how to handle CLIs, it might be _very_
useful.

Yes... offline, a shift-reload in 2.7 will read and load every file
again. 2.5 won't reload the images, which can be an annoyance when using
it for authoring: if an image is changed in some way other than its pixel
size and a reload is performed, 2.5 uses the image already cached
(thinking it hasn't changed in any way). The image cache has to be
flushed first before it will go back and reload the images. I like the
way 2.7 does it -- the correct way, saving a few mouse-clicks to flush
the cache.

> system itself uses the hardware).

I don't agree with your definition of 3D acceleration hardware (but I am
not up to date with the current terminology of accelerated graphics
cards).
2D acceleration is about bitblits, drawing lines, (filled)polygons and
(filled)ellipses. The filled polygon routines are not part of 3D
accelaration. As you say, most OSes support filled polygons, but they
are
in the 2D section, together with the line drawing, bitblit and
ellipsedrwaing
routines.
3D accelaration is about giving the hardware the 3D coordinates and fill
patern
of a triangle and the hardware drawing it as seen from some given 3D

coordinates.
z-buffer memory is needed for processors like this.

> Once again: "Accelerating 3D" has nothing to do with "accelerating 2D".
> The difference of the time needed by the processor to calculate the 3D output
> (floating point arithmetics) is *so* big, that you can't see/feel any
> faster drawing of single lines.

For most 3D games and demos this time difference isn't that big. The
calculation times are of the same order as the drawing times. Both
parts have to be optimized like hell to get maximum performance, this is
true both on the ST as Amiga(500).

We are having this discussion just because the to times are so close
to gether. When the 3D calculations part was the main bottle neck the ST
would be the fastest machine in all cases, with graphics output as
bottle neck the Amiga would be up front.

> PS: To accelerate floating point calculation you can use:
> 1. a faster CPU (which does the calculations faster than a slower one)
> 2. a FPU (which does the calculation instead of the CPU)
> 3. tables with precalculated values (no or less floating point calculations
> by a system without a FPU, the values are just pulled out from that table)

4. use logarithms to do your multiplications and use a log table
to convert them int 'normal' integers. With a well chosen fixed
point base for the calculations the roundoff errors won't be visible.
5. Use fixed point representations instead of floating point.

> The first one is what we are talking about, the last one is a trick used by
> coders to got faster movement of objects (or "3D" output? But that would
> be a very large table ;-), which look "real-time calculated", but in fact it
> isn't.

There are numberous tricks for doing the 3D output faster. That makes
the
whole subject so interesting.

bye, Hans

Hmm .... I've got some docs here in an archive called SCSI2.ZIP
(291Kb) which is split into 4 parts. I've no idea where I got 'em
from.

Any use? I'll file attach if you are interested.

>explain me *what* I have

You have a 68000 based machine with a GEM-like operating system in ROM. You have 1Mbyte RAM. With the SC1224 it will run in two resolutions 'Low' and 'Medium'. There is a lot of good shareware you can run on this basic configuration.

>and *what* I can do with it as far as expansion
>possibilities? Like, how much memory can i put in it and ho whard would
>it be to add a hard drive/SCSI interface to it?

You can add a mono-monitor (e.g. SM124) to run in 'High' resolution.

You can increase RAM to 4Mb using a Marpet Xtra RAM board and appropriate SIMMs.

You can add a chain of SCSI devices by using a 'host adapter' (e.g. Link 2) from the 'Hard Disc' (DMA) port. You will need driver software.

You can run a modem at up to 19200 on the Serial Port.

Look a FAQs at Hallvard's (or other) sites to find out more.

John,

Nice to hear from you. <G>

Geez, RAM's the problem with Newsie too? I've got 42 megs in this TT,
fer heavin's sake! LOL

Is Newsie compatible with Outside, the virtual memory manager? If so,
I've got the latest version around somewhere, I could install it if it
would help. This is the only time I've had a memory problem.

Well, I can't explain why CAB 1.5 and 2.5 will not work if v2.7 WILL.
Very funny.

The timeout display just reassures you that CAB.OVL is working but
waiting for a file to be delivered over Internet. I have found that if
the file does not arrive before timeout reaches 100 it never will and
the best thing to do is to 'Stop' that particular transaction.

Oh well. most people will have seen this before, but...

The Atari Computing Convention: ACC '98 Show Info Bulletin 1
==========

*** Please spread this bulletin far and wide! ***

First of all thanks to everyone who returned the survey forms in Atari Computing issue 8. The majority of respondents wanted an Autumn show in Birmingham and with that in mind we're delighted to announce the Atari Computing Convention "ACC '98" will take place on Saturday November 14th 1998 at Bingley Hall, Staffordshire Showground, Stafford from 10am to 4pm.

The Showground is easily accessible by car from junctions 13 and 14 on the M6 just north of Birmingham with ample free parking and they'll be a shuttle bus service running from Stafford railway station.

Between now and November we may be able to organise a coach trip to make it easier for Londoners to attend if there's enough interest.

Tickets will cost less than ever before - just £3 on the door with discount for Atari Computing subscribers with further reductions for children, OAPs, UB40, students and orange card holders.

Here's just some of the attractions we've lined up:

* The specialist Atari hardware and software dealers who collectively offer all the hardware and software required to ensure the Atari platform remains a viable alternative to mainstream machines.

* The traditional annual forum where Atarians can get together, discuss the latest developments, put names to faces and enjoy the company of other like-minded computer enthusiasts.

* Titan Designs
Their stand will be primarily demonstrating and selling DA's Layout and Nemesis, along with our other support products such as Videlity, APEX Media, etc.
They will also be selling the usual range of products; Scanners, Hard drives, SyQuest drives, CD-ROM drives, Falcon 14MB memory upgrades, cables, etc. Larger items, monitors etc, can be ordered on the day for despatch the following week.

* 16/32
[More details in the next bulletin...]

* FaST Club
[More details in the next bulletin...]

* System Solutions
[More details in the next bulletin...]

* Floppyshop
[More details in the next bulletin...]

* Abingdon Synthesis Projects
Will be building CD-ROMs, hard disks and other SCSI devices into standard PC cases and connected to Atari machines.

* Electronic Cow
[More details in the next bulletin...]

* ImPrint Solutions
Calamus SL 98 will be up and running on a Hades and under MagiC Mac with 21" monitors. Calamus Digital Publisher for the PC platform will also be demonstrated.

* Atari Computing
Our stand will carry all available back issues, Reader Disks and Reader Offers and for the first time ever we will be running demonstrations and advice clinics covering all the major aspects of computing including MIDI/music, DTP/word processing, Comms/Internet access and emulation.

* InterActive
For the first time ever InterActive will be accepting registrations "live" at the show.

* CyberSTrider
For the first time ever CyberStrider will be accepting registrations "live" at the show - is there an echo in here somwhere?

We're delighted most of the UK based companies who supported previous Atari Shows have signed up and we're still canvassing for support from other companies. If you're a potential exhibitor we haven't contacted already please do drop us an email and we'll be pleased to send you the details.

No doubt you're wondering how can we bring you a bigger and better Atari show than ever before and keep the prices so low, well the reason is simple. Atari Computing have decided to work together with Sharwood Promotions who have organised computer shows since 1988.
ACC '98 has been combined with their twice-annual general computer and electronics show which means you effectively get two shows for less than the price of one!

We've watched Atarians drift away from recent shows because there's nothing left to do or see after several hours. We feel, after having made the effort to travel to the show, you'll enjoy the extra dimension offered by the other stands.

So in addition to checking out the latest hardware and software releases and spending some time chatting with familiar faces there will still be plenty to see with stands offering general computer hardware, accessories, cables, CDs, books, satellite, telephone, radio and general electronics.

If you have any friends who have moved onto other platforms why not bring them along? We're really looking forward to seeing you at ACC '98, we'll keep you up to date with the latest developments over the coming months.

1374. WTF: Vendor that has Chronos, ANM-Link, Phase IV Products

Newsgroup: comp.sys.atari.st
Date: 1998-06-25 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <6mubvg$s2k@news.Hawaii.Edu>
Source record: 98443

Greetings,

I'm trying to get ANM-Link (made by Lexicor) and would appreciate
it if anyone can direct me to any vendor that may carry it. I have
checked with every Atari vendor that I can find, and at this point I
imagine that this is a product that is no longer available anywhere, but I
thought I should ask here.

Aloha,
John Perez - jperez@hawaii.edu

1376. How to send files to PC users

Newsgroup: comp.sys.atari.st
Date: 1998-06-25 00:00:00 UTC
From: mike.borsley@zetnet.co.uk
Message-ID: <6mucrm$6qj$1@irk.zetnet.co.uk>
Source record: 98445

I have been trying to send some file attachments to some of my PC owning friends without success. I've only tried it with Newsie - first using UUE which they seem to be able to decode, but don't seem to end up with the complete file. Encoding the file using Mime seems to arrive on their screen as text that they can't do anything with.

I wondered if anybody else has had this problem and solved it. I can send files UUE encoded to Atari users OK no probs.

Any replies would be appreciated.

Cheers

Any idea what mail client your PC friends are using ?

You can always send me a (small!) test mail, and I will try it out with
some mailers (under SunOS). Not exactly PC, but if I find no problems,
then the cause probably lies with the PC's.

Can you be more specific? I've been using VFAT partitions for months now,
and I've had no problems with Freedom, the Apex viewers, STinG, NEWSie or
CAB. (I haven't used those other programs.) CAB even recommends you use
long filenames.

Are you using at least MagiC 5.11?

l> came from Graftool and was something like 800 kB...

I created a 15-bit IMG file with Imagecopy and neither Magxdesk nor Ease
would handle it. Neither crashed, though.

l> I used to have Thing display a 256 color IMG, but it takes time
l> to "set" the desktop everytime and also consumes lotsa RAM... so
l> now it just shows a desktop in dark grey color.

Ease takes a very long time to display a large 256-color IMG the first time
after changing resolutions, but Magxdesk displays it almost immediately. You
can get around the Ease slowdown by using small 256-color tiles, as they
don't take long to load. I would imagine Thing would have similar results.

j> "thingimg.ovl" (or something like that).

That sounds similar to the way Ease works. The first time it loads the pic after changing res, it takes a very long time. But after that, it loads almost immediately. But this 'cache' only lasts until you change res again.

My question is, why does it even need to do this? Magxdesk displays the same pic almost immediately the first and every time. Even DeskPic is much faster.

r> back and reload the images. I like the way 2.7 does it -- the
r> correct way, saving a few mouse-clicks to flush the cache.

You missed the point. CAB 2.7 reloads the images even if you don't hold the shift key down and even if the images are already in the cache. If you're at a page that frequently updates (such as a sports update), it's extremely annoying to watch it reload every single graphic every single time, when the images are already in the cache. And it does this even if the html hasn't changed.

I have found that in such cases, pressing ESC will give the *software
caused abort* message and then it retries, often with success the
second time. Pressing ESC a second time, however, will abort the
transaction completely, giving the *FILE NOT FOUND* message; pressing
reload will sometimes bring success at this stage!

NEWSwatch can be found on my web site (see my sig), and Okami can be found
at: http://www.xs4all.nl/~josdb/okami.html

I'm not actually sure where a recent version of Oasis2 can be found. I'm
thinking of digging out the last non beta version I had and adding it to my
website, but that won't be for a few weeks.

Gary

Hi Mike,
I am an Atari user that uses a PC to connect to the Net.
I have had email w/attachments sent to me from other Atari users and
they end up on my machine as 0k files. If you can send attachments as mime
compliant
then that is the way to go, also use the archiver zip, lzh, arc to compress
the file(s) that you are sending.
I have no problem downloading Atari zipped files then unzipping using Winzip
on my PC and then transfering
the unzipped files to my Atari.

Send a test attachment using the method above and I'll let you know how it
goes.

You are right here. That's because Atari developers found it obsolete
to support more than 256 colors for IMG images. I have developed an
appropriate extension and published supporting C source code some years
ago, because I needed it (but nobody else, apparently). The Snapper can
produce screen snapshots in this format, and just recently I wrote a
converter to the common PNG format. It was surprisingly easy to write
(took me only a few hours), based on my old (T)IMG source code and the
common libpng code (see http://www.esc.de/homes/guivol/1stguide/snaps/).

The funny thing was: First I needed only the high-color conversion feature
and took a routine which was intended only to unpack the TIMG extension
(palette images could be handled with alternative conversion tools).
Then I discovered that the same old routine, without any change,
could also be used to unpack and convert the given (X)IMG formats.
This was final evidence that the original extension design was the
most straightforward, providing maximum flexibility with minimum
additional coding effort (no additional effort for the IMG decoder
and depacker, in fact).

Regards,
Guido

Well I've had a 520St & FM before I bought the 1040STE a few years ago,
and I had a mate living a few doors down who used to always borrow my modem
for his Amiga, and another bloke who borrowed it a couple of times for his
PC clone.
They both used my chords.
So going by that I'd say pretty standard.

I don't know how any of those problems would be caused by using long
filenames, particularly the STinG problem.

Hi,

Ii¿½ve got a Junior Prommer by the german manufacturer MAXXON and like to use it with my PC too. At the box there is a reference with regard to Amiga, Atari and PC-systems. Does anyone knows something about a working version or has a good link for me? Just tried with some emulators (MagiC, PaCifiST...) but no success at the time... :(

Best wishes - M.M.

Hi,

There are hundreds of programs for making music and listening
to music which you can download at
http://www.hitsquad.com/smm/atari/

There is mainly ST software but there's also some for the
Falcon.

The site has software for midi, MOD, audio, recording,
multi-track, MPEG, soft synths, drum machines, guitar tuners,
samplers, patch editors/librarians, mp3 players, sequencers,
algorhythmic composition, and heaps more.

Just got a couple of questions.

1st What program(s) are available to connect the LAN ports on the STE and TT machines, and where can one locate these programs?

2nd. Finally got NVDI to work on my STE. Think it was the hard disk driver software causing the problem. What is the most current version of NVDI? Currently I am using 4.0. Where can I find a listing of FAQ's

3rd and last. What is the latest version of MagiC ? I currently am using 4.0 on one machine and Gevena on the other. How about FAQ's location

Thanks for the help in advance.....

Simple - if you're running MiNT....

If not, you could set it up (without the hassle of a full multitasking AES
or any of the really complex Unixy stuff). Alternatively, if you know anyone
with Linux, or if you can get access to a Unix machine at work, etc., simply
use "cat" from the command line.

If the files appear in the order you want when listed (using "ls") from the
command line, just use "cat * >outfile.txt" from within the relevant directory.

If they're not in the right order, things might get more complex. I don't
know if cat can take a file list directly, or if you'll need a shell script
- hopefully someone who uses Unix a bit more often than me will be able to
answer.

I thought about it when I started my current project to rehouse my Falcon. Unfortunately, being an engineer, I tend to wing it a bit, rather than preparing everything at the outset. This tends to result in sporadic periods of work, then long periods of not being bothered, and a job that gets assembled piecemeal - i.e. not a very good example for a "How to" guide in a magazie.

As an example, I started rehousing my Falcon in November. Current SOP: it has no shielding, the floppy drive sits upside sown on top of the case on an extension lead, most of the ports are missing (desoldered), except the monitor and modem ports which have been resoldered onto flying leads in order to keep the thing operational; the case it's going into had to be cut and hacked to make it fit, the PSU was turned round (more cutting & hacking) leaving a gaping (fist sized) hole directly into the guts of the machine, the fascia is in the loft. Oh, and the monitor select pins and the reset connections (button desoldered) have been brought out to flying leads which are appropriately activated by holding them together with croc clips.

Estimated time for completion: hopefully before the year's out. Hopefully.

And you want me to write an article on that!!! <vvbg>

got this info
>

What you need is a mixer. Most beginners audio electronics books will show
a design for one (usually using the ubiquitous 741 op-amp - a device that
all engineers know the circuit diagrams for, but which none have ever got
to work properly in practice). Best solution though, get thee down to Tandy
and pick one up from there (a four input device should cost about 30-40 UKP,
you might find a 2 input one for less, if you're lucky).

Note, however, that "4-input" is _usually_ 4 mono inputs, so this will do
two stereo devices. Talk it over with the saleschap(pess), as you might end
up requiring two of them to prevent the L & R channels also being mixed
together.

Same problem here ... no way to make it work !!!! Spacola seems to
refuse to work in any configuration on ANY machine .... almost
incredible !!!! I have already tried on STF, STE, Mega STE, Mega ST
and TT030 ...
Oxyd 2 is in the same case ..... a pity when you know the quality of
Oxyd and Oxyd magnum !!!!!

The only way to make them run is to run them from a Falcon in ST high
!!

I can absolutely not understand that because both games were made
BEFORE the falcon appears on the market !!!!!!!!!!!!!!!!!!!!!!!!

YES, WE NEED HELP TO MAKE these both games to run !!!!!!!!!!!!!!!
I have already posted this help post a few times ago on this server.

So, we are now two guys searching the big Manholf Schneider secret !

Oxyd 2 needs a german TOS to work (KAOS 1.4.2 works fine too). We had
some
problems at our Atari computer club with the game. Atari Nederland send
around a diskette with a demo version of Oxyd 2. It worked fine on my
machine, but all normal Ataris, with the normal TOS versions had
problems
with the game, that is, the game didn't work.

I never took time to find out what exactly was going wrong, but I am
pretty sure it has something to do with differences between a German
TOS version and the UK one. The strange thing is that the game still
works with heavy modified derivates from the German version (like KAOS).

Bye, Hans

Because MagXDesk is a much better written program. Just look at the size! MagXDesk is much faster on almost everything you can imagine. Just to pitty Andreas doesn't want to make a "pro" version of it. I guess he wants the other desktops to have a chance as well. If he wanted to, he could make lots of desktop programmares out of work and ASH wouldn't earn as much money. :-)

> And it does this even if the html hasn't changed.

Well, you didn't specify whether you meant an offline or online reload, which are handled in different ways. The latter is more complicated.

Offline, CAB has no idea if any local files have changed (disregarding a local protocol such as OLGA). But online, http is smart enough to know if a file has changed based on the server timestamps, comparing those in CAB's disk cache, whose timestamps come in intact (take a look at them). In such a case, during an online reload, the server will know that filename.gif changed in some way and will send it along with the html (which is sent regardless of a timestamp). At least I think this is the way things are supposed to work. And in my case, most of the time it does work like this (depending on the server). I'm quite sure online reloading is handled by the cab.ovl. For me, using CAB 2.7 and cab.ovl 1.2904, an online reload (shifted or not) doesn't go back and get all the graphics. For the most part, it seems to be working the way it should. But on some sites, I've seen it do the opposite, ignoring what's already in the disk cache and grabbing everything again (a failure of the cab.ovl with that particular http server).

I think Ease needs to do this so the graphic can be adapted to the system palette and screen size. Whatever the reason, why not create multiple picture.scr files and have XBoot handle them based on the resolution to be booted. This way Ease might not have to recalculate things. I've never tried it, but use a similar method for handling Ease's icons, which are adapted after a resolution change, too. Now I have pre-cached versions of the icons, so Ease boots much faster. The same principle should work for a background graphic.

It is for standard portable ANSI-C :-). I have used it with Pure-C on Atari
and with GNU-C (gcc) on SunOS and PC-Linux. The img2png converter was only
run with gcc until now. If somebody needs it on Atari, let me know, and I
can adapt it (main task would be to get the public PNG library running -
the actual converter code is pretty short and simple).

Well, I think I'll put together the actual code (still somewhat incomplete
due to lack of request, but useful anyway) in an archive for download
immediately. Wait a moment and watch out for a link on the given
snapshot page...

Regards,
Guido

>group.

0.88 - and I was aware that this bug had been fixed, we did discuss it on CIX, but in my case the problem is still there :-((((((

To clarify, the full group listing is downloaded, the trouble is the sort and writing to disk operations appear to trash the downloaded listing and leave me with a sorted (?) listing only about half the size of what it should. This truncated file can't be read by NEWSie, presumably because the index file is corrupt or incomplete.

It wouldn't be so bad if the full group listing was left intact, but it isn't :-((((

Kind regards
Mike Kerslake

Hmm ... I've found that many PC users cannot accept UUE. In fact the
UUE supplied with Newsie often fails to produce the attachment.

I now try to remember to use MIME for all files and have had no
complaints from PC people. I wonder whether your addressees have their
IE or Netscape set up properly? There are probably dialogue buttons to
press somewhere which opt for 'type of coding' and 'auto decoding'.

> filename.gif changed in some way and will send it along with the html
> (which is sent regardless of a timestamp). At least I think this is the
> way things are supposed to work. [...]

More or less, yes. Some things to remember:
- each file (HTML and each embedded image) is fetched from the server
in a separate, independent operation.
- when any file is fetched, the server may optionally attach information
(HTTP headers) to the effect that the file will become obsolete at
some time, and/or that it is not a good idea to reload it from cache
(the Expires: and Cache-control: headers). It can even serve up a
file with an indication that it is *already* obsolete (like a PC
when you buy it. :>)
- when asking for a file, the browser may optionally attach a precondition
like "only if it has changed since ..." (HTTP If-modified-since: header).
If the condition isn't met then the server will just answer with status
304 Not Modified.
- a lot of browsers handle cacheing strangely: in particular Netscape's
behaviour is extremely quirky, and a major cause of hair loss. So if
CAB behaves differently to another browser, it ain't necessarily CAB
that's wrong.

Note that I haven't yet tried out CAB 2.7; remind me to get that Round Tuit
sometime.

1432. AppleEmu

Newsgroup: comp.sys.atari.st
Date: 1998-06-26 00:00:00 UTC
From: ut13@rz.uni-karlsruhe.de
Message-ID: <3593b8248565e0@rz.uni-karlsruhe.de>
Source record: 98601

Hello,

I have some experince with Apple II, that's why I was interested in
the Apple II emulation. The only emulator for Atari I know is the
APPLEEMU by Darek Mihocka.

The system is a Mega ST 2 with Megafile 20 hard disk.

I have following problems (please tell me if someone else
had similar problems or is it something wrong with the real
computer [1]):

When using the APPLEEMU without booting from the HD:
-all starts OK, but:
+ Applesoft BASIC's HPLOT works fine, but HPLOT TO draws wrong lines
and it seems to write in wrong parts of the memory.
+ If I don't type on the keyboard, an inverse M appears every 10-12
seconds and it is treated like keyboard input (after pressing Enter,
an error is reported). This doesn't happen always.

When using the APPLEEMU after booting from zhe HD:
-the results are unpredictable (at least for me), loading APPLSOFT.BIN
and starting with B doesn't start the 'Apple', but causes an interriupt.

```
>R APPLSOFT
Reading...
start D000 end FFFF

>B
PC=FE85: A=00 X=00 Y=00 S=FE P=10 ..B.... 883A

>B
---"--- S=FC ---"---
>B
S=FA
...
```
(I don't know if it was the same all times I tried it.)

I have tested all these with Blitter ON and OFF.

1) Sometimes I see two bombs in other programs or while booting and
sometimes the keyboard input goes crazy in the TEMPUS text editor.

Has anyone similar experience? Is there someone who has run the
program without such problems with APPLEEMU?

Bye
Guentcho

><< Neil >>

The problem is many servers don't support the Last-modified field.
So There is no way to tell what the actual date of the file is. Some
browsers on other platforms go to great lengths checking and comparing
retrieved files to copies on the hard drive to see if theyhave changed.
This can work but is not fool proof and leads to bloatware. It would be
nice if people would properly support the specs for a protocol when they
write server software. But in the Wintel world they don't seem to care :/

I believe it has 8 Meg. of memory with the PTC XXXX 15" color monitor.
I addedan external hard drive which I think is 400 or 500 Meg. I have
loads of software
some of which is from an ST that I use to have. I can also throw in a
24-pin
Toshiba printer with about 8 extra ribbons and a sheet feeder. But I
need an honest
price before I can sell it.

Thanks,
Chuck

I don't think it's "a failure of the cab.ovl" but rather a problem with
the proxy on the related server where the timestamp can change, for a
reason or another, without any change on the originator site.

Yes it can. I've just double checked. The address for Okami is correct, I've
just been there. Why do you say it can't?

n> Any chance we can get a copy of one??
n> We can see for ourselves then, and we will know exactly what you
n> are talking about.

Turns out that these are apparently doctored JPEGs designed to appear animated on interlace screens. I viewed the best one in a non-interlace mode on my Falcon and the part that appears animated in interlace mode looks very strange, but it doesn't move at all.

I sent a copy to Tom Lane of the Independant JPEG Group and he agreed that it was probably doctored for the effect I was seeing in interlace mode. He said it appears that the 'animated' area is actually scanlines from two separate images sewn together. The alternate display of scanlines (odd lines, then even lines) in interlace mode gives the effect of an animated pic.

It's actually pretty cool the way they did it.

If anyone wants to check one of these out, and doesn't mind female nudity, let me know and I'll send you a copy.

Imagecopy supports 16-, 24- and 32-bit IMG files. Other Atari programs also support high/true color IMG files. Is this the same type of "obsolete" as the GIF format? :^)

Re: "Nova Desktop Picture", roughley@HORMEL.unix.dsoe.com scribbled the
following on 26 Jun 98 @ 09:04:47:

r> I think Ease needs to do this so the graphic can be adapted to
r> the system palette and screen size. Whatever the reason, why not
r> create multiple picture.scr files and have XBoot handle them
r> based on the resolution to be booted. This way Ease might not
r> have to recalculate things. I've never tried it, but use a
r> similar method for handling Ease's icons, which are adapted after
r> a resolution change, too. Now I have pre-cached versions of the
r> icons, so Ease boots much faster. The same principle should work
r> for a background graphic.

I thought of doing this (for icons, too), but that would require a cold start
and then waiting for Stoop to load and then selecting a new configuration.
Then doing the same thing when changing back. And then every time I made a
change, I'd have to copy the changes to whatever directory Stoop is using.
So much of the time saved would be negated.

It still might be worth it, though. It takes quite a long time when
switching to high-color, though switching back to 16-colors is very fast.

Then again, I'd give up the ability to have random background pics, unless I
created a pre-cached version of each pic. Hmmm...

Re: "CAB Demo 2.7", roughley@HORMEL.unix.dsoe.com scribbled the following on 26 Jun 98 @ 09:03:56:

r> Well, you didn't specify whether you meant an offline or online
r> reload, which are handled in different ways. The latter is more
r> complicated.

I was talking about online reload.

r> Offline, CAB has no idea if any local files have changed
r> (disregarding a local protocol such as OLGA). But online, http is
r> smart enough to know if a file has changed based on the server
r> timestamps, comparing those in CAB's disk cache, whose timestamps
r> come in intact (take a look at them). In such a case, during an
r> online reload, the server will know that filename.gif changed in
r> some way and will send it along with the html (which is sent
r> regardless of a timestamp). At least I think this is the way
r> things are supposed to work. And in my case, most of the time it
r> does work like this (depending on the server).

When I said the graphics get reloaded, I meant reloaded from disk (i.e. "Loading... Converting..."). They don't get re-sent. And this happens even when the html doesn't change. I'm not sure if it happens with all pages, but it's happened with every page where I've been paying attention.

r> I'm quite sure online reloading is handled by the cab.ovl. For me,
r> using CAB 2.7 and cab.ovl 1.2904, an online reload (shifted or
r> not) doesn't go back and get all the graphics.

I'm using CAB 2.7 with the latest cab.ovl beta. Perhaps that is where the problem lies, and not with CAB. I'll have to see what happens with 1.2904 and/or the PPP-Connect cab.ovl from CAB 2.5.

And again, it's not going back to get all the graphics; it's just reloading them from disk, even though they're in the cache.

MK> Because MagXDesk is a much better written program. Just look at
MK> the size! MagXDesk is much faster on almost everything you can
MK> imagine.

I don't think its size makes it a better program. Ease has a ton of features not included in Magxdesk, so of course it's going to be bigger.

I could be wrong, but I think possibly the reason why Ease takes so long to "adapt" a background image is because of all the different options available for background images. Not only tiling, but the Replace/And/Or options. Maybe it needs to adapt the images to a special format before it can use all those options.

It's proprietary and useless without open documentation and free portable
supporting source code!

> Is this the same type of "obsolete" as the GIF format? :^)

Hey, GIF is still obsolete for me due to the color limit, and IMG *would*
be obsolete for me as well *without* an open extension for HC/TC modes!:-)

Hello all,

I recently went through my ST Review Disk collection and found that my disk from issue 19 with Flair paint has become corrupt!

Does anybody have this disk or know where I can obtain a copy of Flair paint! I can exchange any other cover disk from issues 13 to 35 or any cover disk from ST format issues 66 to 72.

Please reply via email as I do not get to check the news often!

PS I have now learned my lesson about keeping backups and have purchased a new Zip disk and started going through my collection with MSA ;)

Thanks.

Jerry Martin

This is a totally different story, almost definitely not related to the
CAB.OVL, and is not a problem new to CAB 2.7 or to recent OVL's.

What's happening, I think, is that CAB simply cant cache very much in the
RAM, and the only way CAB caches to the hard drive is in the original
picture format, which means if it has to reload from the disk cache it
also has to translate the picture data into whatever internal data
structure it uses, resizing the picture and redithering the picture in the
process (assuming these steps are necessary). All of these steps take
some time. This is one place where the Adamas browser is significantly
better. It saves the files to its disk cache all ready to plop back onto
the page. Redraws are tons faster (although CAB is faster at the first
display because its conversion/resizing/dithering algorithms seem to be
faster).

Sorry if I misled you, Terry: I _thought_ I got the demo from
InterActive. You can get the full registered version direct from
Mark Wherry for £9.99 cheque to him:

```
Snail mail: 4 Fernpark Close,
Topsham Road,
Exeter,
Devon,
EX2 6AW

He would probably email the demo if you prefer:
mark_wherry@cix.co.uk

Cheers,
Charles.

I use Harlekin3 (3.11) all the time with Magic (5.11), sometimes with its
ResetMem.prg (placed immediately after MagxBoot), but mostly not,
especially when the amount of memory is critical for, eg, internet.

No _proven_ problems: just a suspicion that its use of the 200Hz
interrupt may sometimes interfere, so I have recently assigned it
to use VBL instead (see Vectors module and Manual page 17).

Cheers, Charles.

>1.) Do you still use any TOS platform computer?

STe

>2.) Do you use a PC, and if so which Atari emulator if any?
Yes, PaCifiST.

>3.) Do you still play ST games, even occasionally?
Do I use anything other than computer games on an ST/emulator

>4.) Assuming you can play a certain game on PacfiST, you would want to
>make a backup copy yourself for playing it on the emulator or look for
>it on the Internet? (Hypothically speaking, you are able to make a image
>to be used on PacfiST)

Depends if the version I have got is for the STe then I have to look for the
ST
version on the net. Otherwise I will use an image of a disk.

>5.) Giving the current situtation of the ST platform, what are your
>feeling of copying commerical software and distrubuting over the Internet?
>(Legalities are well noted, just your honest feelings about it)

Yes it's wrong, but as I said above I can't use an STe game on a plain ST
emulator.

>6.) Would you like to see ST emulators play more games?
Yes, definately.

>7.) Do you plan on getting a Hades or Milan type machine in the future?

Wish I had the cash.

>8.) If you have a high end machine, would you like to continue to play
>your favorite ST games on them if it was possible? (Not only includes 040

s> Isn't there some way to set up a mailing list
s> that doesn't append spam to the bottom of
s> each email?

Yes, for instance Net2Net does mailing lists very nicely. But it depends on the person running the list to go to his mailbox, retrieve all the mail in the list and then send it out to everybody in the list. N2N does all the list work, but the mail only moves as fast as the list coordinator dials up his mailbox.

With something like Onelist (which is what the Magic list uses), the mail goes out to the list almost immediately, because it's always connected to the net. So perhaps it's worth a little spam at the bottom of each mail. Frankly, I don't even notice it anymore.

r> this.

Maybe a bug? CAB 2.5 uses the cache, but 2.7 does not. I can't think of any
possible good reason for it doing that. I can see it loading from disk if I
have the shift key held down, but that makes no difference.

Source record: 98197

We have a nova card of second hand but...
Well ... we had a lot of problems here before make it work ...

I have sold the card to one of my members and he has just succeeded to make it work, but, there is a but ..... He cannot see anything on its screen before the desktop appears ...

So, it's a little annoying to not being able to select a resolution ... for the moment he is only able to boot with a black screen and coming to the desktop with 1024*768 in black and white ...

NVDI's screen drivers are disabled

when I try holding down the two shift keys while booting I can't see the menu on my screen so black...
the NOVA files boot are in this order:

emulator.prg
emulator.bib
menu.prg
sta_vdi.prg
sta_vdi.bib

NVDI is next, and its screen drivers are disabled!
I think that's a resolution problem.
Do you have an idea to help me.
I seen a VMG.PRG, but without doc, it's difficult to use it.
Do you have any explications for this programm.

thanks

Luc

Hello,

I recently downloaded the latest version of Popwatch. At first, all was well, as with earlier releases, but something odd has started happening: now, when I try to retrieve messages from my server, it gives the confirmation message WITHOUT actually retrieving the messages (into Newsie); furthermore, when I disconnect, it reads this as a 'delete' instruction and I lose all my messages! I've no idea why this should happen, especially as it didn't at first. Has anyone else encountered the problem?

Cheers,
EDK

There is program I have used many times to decode e-mails for people
at work that their mailer was having trouble with. It is called
UUDWin, or something like that. Try http://www.software.com and
search for uudecoding.
Save the e-mail out as a file and load it into UUDWin and it will
sort it out for you.

Rich.

: overwrite kind)?

: Price? 800-number? website?

This will depend on the brand of drive that you have, I think. I have one type of drive, the Panasonic PowerDrive, and the carts for this cost about $25. Try at http://www.uvision.com This is a price index for many vendors on the Internet, and you can find good deals on many types of computer equipment and supplies. You will have to search with terms like 640 magneto optical, or perhaps 640 mo rewritable. Try a few things and once you determine the naming that the index uses you can narrow it down to your brand or type of MO.

Cheers!

Having had to replace my ICD Link with Toplink, I now can't access drives after P on my STFM or format the drives, as none of the ICD sw works without the Link.

Advice as to what I need and where to get it from? I need to wipe the odd Partition and juggle same. There is something called BIGDOS on the HD driver disk but all the docs are in German.

Hello Hans,

mn> I meant the hardware capebility for drawing polygons, which, according
mn> to
mn> your answer, is not available to the Amiga.
Correct :-)

mn> As you say, most OSes support filled polygons, but they
mn> are in the 2D section, together with the line drawing, bitblit and
mn> ellipsedrwaing routines.
Yes, but not all are supported by hardware 8-)

Everything is possible just by software, but that's not what we're talking

about, or? ;-)

mn> For most 3D games and demos this time difference isn't that big. The
mn> calculation times are of the same order as the drawing times. Both
mn> parts have to be optimized like hell to get maximum performance, this
is
mn> true both on the ST as Amiga(500).
Sure, and it's very interesting to see the (sometimes astonishing) results
of
the coders, isn't it? :-))

mn> There are numberous tricks for doing the 3D output faster. That makes
mn> the whole subject so interesting.
I would agree. But I think, the better the hardware is, the faster people

forget the "tricks" ;-)

I hate to be a pessimist, but I would not recommend a Zip disk as a
reliable alternative to a floppy. I've had them go bad, completely bad,
overnight while sitting in an empty drawer.

Optical storage is much better. Make a ZIP backup of all of your disks
and then find someone with a CD-R to put them on a CD for you.

Cheers!

If you have a viewer that will let you "zoom in" on a section of the
image, it's hard to avoid coming to that conclusion. Once you can see
the individual pixels clearly, it's obvious that alternate scanlines
are very different (at least in the sample Terry sent me).

> The alternate display of scanlines (odd lines, then
> even lines) in interlace mode gives the effect of an animated pic.

Seems like a cool trick, actually. I'd never seen one of these, nor
do I own any hardware on which the effect would be seen as intended.
I wonder whether this trick is specific to Ataris, or whether there
are other machines on which it works...

Keep in mind that some of the PC software has defaults that limit the
size of an encoded attachment(that can be received). A lot of users don't realize
this and wouldn't know where to change the limits if they did :).

1505. AppleEmu

Newsgroup: comp.sys.atari.st
Date: 1998-06-27 00:00:00 UTC
From: ut13@rz.uni-karlsruhe.de
Message-ID: <6n29jksk2@nz12.rz.uni-karlsruhe.de>
Source record: 98355
Cross-posted to: comp.sys.atari.st,comp.emulators.apple2

Hello,

I have some experince with Apple II, that's why I was interested in
the Apple II emulation. The only emulator for Atari I know is the
APPLEEMU by Darek Mihocka.

The system is a Atari Mega ST 2 with Megafile 20 hard disk.

I have following problems (please tell me if someone else
had similar problems or is it something wrong with the real
computer [1]):

When using the APPLEEMU without booting from the HD:
-all starts OK, but:
+ Applesoft BASIC's HPLOT works fine, but HPLOT TO draws wrong lines
and it seems to write in wrong parts of the memory.
+ If I don't type on the keyboard, an inverse M appears every 10-12
seconds and it is treated like keyboard input (after pressing Enter,
an error is reported). This doesn't happen always.

When using the APPLEEMU after booting from zhe HD:
-the results are unpredictable (at least for me), loading APPLSOFT.BIN
and starting with B doesn't start the 'Apple', but causes an interriupt.

```
>R APPLSOFT
Reading...
start D000 end FFFF

>B
PC=FE85: A=00 X=00 Y=00 S=FE P=10 ..B.... 883A

>B
---"--- S=FC ---"---
>B
S=FA
...
```
(I don't know if it was the same all times I tried it.)

I have tested all these with Blitter ON and OFF.

1) Sometimes I see two bombs in other programs or while booting and
sometimes the keyboard input goes crazy in the TEMPUS text editor.

Has anyone similar experience? Is there someone who has run the
program without such problems with APPLEEMU?

Bye
Guentcho

> reloading them from disk, even though they're in the cache.

This is the complete opposite of how an offline reload works, as it
uses what's in the image cache. One would think an online reload should
do the same. There must be some reasoning behind this.

I was told that early Zip media from a certain manufacturer was prone to failure. I'm not sure if this is true or not, but it was told to me by someone who would know. Evidently that has since changed.

All my stuff is backed-up on Zip disks, some of which get heavy use. So far the failure rate (zero) is much better than I experienced with high-density disks.

Why not just run Mac software instead? Unless there are some 'must-use' GEM applications you want to bring over. Ahhh... knowing you, you'll have Netscape in one window (under MacOS), CAB in the second, and Internet Explorer (under Win95) running in the third ;-). But are you sure it'll run MultiTOS <snicker>. Seriously... what a lovely system, Charles. I'd like to see some benchmarks once you get MagicMac up and running.

: failure. I'm not sure if this is true or not, but it was told to me by
: someone who would know. Evidently that has since changed.

The problems that I have had were with Iomega diskettes.

: All my stuff is backed-up on Zip disks, some of which get heavy use. So
: far the failure rate (zero) is much better than I experienced with high-
: density disks.

I have found the failure rate on high density disks to be quite high, much higher than double-density for example, but that's to be expected. In general, I won't trust any purely magnetic media, as it's too prone to damage from dust, moisture, flaking, magnetic fields, etc... They are fine for transfer of data and working, but I wouldn't necessarily expect all of the data to be there five years from now.

That may not be a need for everyone, but since I've been writing music for about ten years, I can see that it would have been nice to have some of the songs that I wrote years ago. After a hard disk failure, and both floppy backup failures, I dispensed with any notion of floppies for long term storage. I've also experienced multiple ZIP failures in the workplace.

I personally prefer magneto-optical as well as CDR and CDRW. It cost more, but not as much as time.

I use ExtenDOS Pro which does most certainly support multisession CD-ROMs.

Do you now? Expect away...

>The language for the list is English.
>
>Do you want to subscribe to the list?
>
>Go to http://www.onelist.com/subscribe.cgi/magic_os
>or click here

Click where? I see nothing to click...

Anyway, the usual way to subscribe to a list is to mail a list
server with a subscribe message, which immediately made me suspicious
of this.

Turns out you would be subscribing to a load of advertising appended
to each message, as if we didn't all get enough spam mail already.

>Important Information:
>To send email to the list, use the email address magic_os@onelist.com

I think NOT, in the circumstances.

>P.S.:
>If any user wants to create a new mailing list, please, tell us before
>creating it, cause we want to coordinate all posible atari
>mailing lists cause we don't want to duplicate efforts.

Read: because we want to control everything and spew adverts at
everyone.

*Does anyone have access to a proper list server (read: one that
operates without adding junk to every message) who could set up a
MagiC list?*

Sorry if this sounds bitter but as I now seem to get about twice as
many spam mails as real messages, I'm more than a little sensitised to
the idea of someone attempting to ram yet more unwelcome advertising
down my throat. Particularly as there's every chance it will be for

stuff that's only available or usable in the US.

NB, no offence intended to the Americans here, just to the peabrained idiots who invite me to "call toll free" across the Atlantic (try it if you like but don't blame me for the phone bill if you actually get it to work...) to find out more about some pointless service that only operates in Upper Sandusky, Ohio.

Time for a public Thank You to Gary Priest for the Reject feature in POPwatch!

I sent the files the same way as always, including various
combinations of UUE & Mime compressed and uncompressed. It seems
strange that the two test files I've sent to yourself and David have
processed themselves without problems. The last one I sent to a
friend in Sleaford. He uses Explorer and said that when he normally
receives a file attachment, Explorer automatically extracts the file
from the general text and requests a path for it to be filed. He said
that the midifile I sent remained as text with the covering email, and
he couldn'nt find a way to extract it.

Does anybody have any ideas how to extract it?

>
> Regards from STEve & his nice warm cosey PAK'd MegaSTE.

Hi

My System has had little problems with the software you mentioned except
cubase, freedom that i dont use,

There are one or two things i have had problems with

Apex viewers will only work if CAB 2.5 isnt running
Apex wont work at all id cab is running
I have never had problems with long file names

the apex viewers will still work with long file names but only if there is no spaces in
the path or file name to the file to be viewed.

This is because the file viewers and indeed most other programs as far a cmd line are
concerened
use spaces to denote a new file

ie c:\files\file2.jpg c:\files\file3.jpg

this is what it expects

if given

d:\jpeg files\largefile3.jpeg d:\jpegs\small jpeg.jpg

it takes it to mean

d:\jpeg
then
files\largefile3.jpeg
then
d:\jpegs\small
then
jpeg.jpg

this may be the problem you are experiencing

the actual vfat system should not make programs crash, as if a program doesnt uinderstand it
it reverts to the standard 8+3 file format to do it's stuff

cheers

ian norton

ftp.lip6.fr, ftp.funet.fi, ftp.leo.org, ftp.uni-paderborn.de, just to name a
few. Try also Jo Vandewedge's UTSI pages.

>And when i download these, how do I convert these from
>pc format to atari format

They will usually be zip or lzh files. Stick them on a DOS formatted 720K
disk (provided your ST has a double sided drive), and use stzip.ttp or
lharc.ttp, etc...

Maybe read the Quick FAQ to refresh your ST knowledge...

>I own a Pacifist v0.48, and i don't understad how to run games in it.
>And i don't understand thepart about disc image.

Because of the incompatibility between ST disks and the PC disk drive, you cannot run most games directly by sticking the disk into the PC drive.

The way around this is to use a PC utility such as makedisk that will read the disk and generate a disk image file (.ST file). This is an exact copy of the disks contents (including extra tracks, sectors, etc...) that is written into a file.

You put all these .ST files into one directory on the PC (the one specified in your pacifist.ini file), and pressing F12 when you're in the emulator allows you to access a disk menu to select which disk image you'll be reading.

Cheers,
Nick

Oxyd 2 ? ...
Well as I reported before, it will apparently only work with a german TOS, the latest solution I'm looking for is to find a floppy german TOS to see if it will work this way ...

I really want to play Oxyd 2 because I have already completely played Oxyd and Oxyd Magnum, also Esprit and Bolo, but for the latest I have not played it until the end ... to hard for me :)

The german author Meinholf Schneider leaved the atari platform a few years ago and if you go to his web site you'll see there is new Oxyd part but only intended to work with Macintosh computer it's called PerOxyd ... a pity Meinholf discontinued atari support I even don't know if you'll yet find some atari files to download from his web site.
Be aware before beginning to play that you'll need the complete book for playing the whole games : only for Oxyd 1 and Oxyd 2 and Esprit ... in this last game you'll only need a few codes at the end of the game !!!!!!

It also exists an editor for Esprit and Bolo if I remember well ... These games are among the best you can find for your machine ... they take a lot of time and experiment to complete but they are really intelligent and require a lot of patience/trial/thinking to resolve the screens and also they are not humorless ...

I recommend them all even to the games reluctant atarists !

Source record: 98387

Well, I did some further research and (thanks to some PC-using friends),
it appears that Netscape doesn't know how to handle UUE and Micro$oft
IE sure as hell doesn't (want to?).

However, I have been assured there exist tools for W'95 to decode UUE
messages.
The reason for the lack of support for UUE seems to be 'obsoleteness', but
that's the lousiest excuse in Computer Science for lazyness.

MIME should be supported as expected. Third-party mail clients for Windows,
(Eudora I assume), may support UUE.

Bye everyone,

s> This is a totally different story, almost definitely not related
s> to the CAB.OVL, and is not a problem new to CAB 2.7 or to recent
s> OVL's.

Uh, yes it IS new to CAB 2.7. I did much experimenting last night, and found that no matter what CAB.OVL I used, CAB 2.5 always used the cache to reload the graphics and CAB 2.7 always reloaded them from disk. The result, CAB 2.5 flies when reloading a page, whereas 2.7 is slow as molasses, by comparison.

s> What's happening, I think, is that CAB simply cant cache very
s> much in the RAM [...]

I have a 6 meg RAM cache, and it happens even if the web site is the very first place I visit after loading CAB. IOW, it has PLENTY of room in the RAM cache. And in fact, if you go to a different page and then come back, it will use the graphics in the cache. It's only when clicking on the reload icon that it reloads them from disk.

ib> if there is no spaces in the path or file name to the file to be
ib> viewed.

Oh really? I've *never* been able to get the Apex viewers to handle LFNs (without spaces). In fact, I have a Mupfel script that automatically renames my jpegs to "temp.jpg" sends it to the Apex viewer and then renames it back. (This doesn't work with spaces in the filename, either.) I have another script that does the same thing for GIFs.

That's not to say they crash or anything, when sending LFNs; they just dump me back to the desktop. Same thing with any filename with a tilde in it (which could also be the problem, since the 8+3 versions of LFNs all have tildes in them).

What desktop are you using?

1543. Multisession CD-ROM driver

Newsgroup: comp.sys.atari.st
Date: 1998-06-27 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <8S6YCPY@tos.pl.net>
Source record: 98642

A member of our Atari user group is having problems accessing multisession CD-ROMs on his Falcon.

He purchased Soundpool CD-Recorder Pro version 2, and supplied with it was Metados. However, with the supplied drivers it will not read multisession CDs. (Although sometimes the CD-ROM control CPX can be used to access SOME of the sessions.)

Is there a driver which will support multisession? I use Spin which works fine, but that only works with MiNT and MagiC and he can't use Cubase Audio with MiNT or MagiC. I tried Extendos which I happen to have but that wouldn't read multi-session either.

Is there some MetaDOS driver that will support multisession? He needs to get this sorted out ASAP! So if you have such a driver, if you could just email it to me straight away or tell me where to find it I would be most grateful!

s> ------------- Quote Ends --------------
s>
s> That's enough for me.

Fair enough. But AFAIK, there hasn't been a single advertisement from an outside source sent to the MagiC mailing list, in the form of a banner or otherwise.

And even if it starts happening, unless they are unweildly, I still think it will be worth the service being offered. I put up with banners (at least those my advertising filter miss <g>) on Web sites, so that I can enjoy the service provided. I see no difference here, again, unless the ads become too cumbersome.

OK, there is a hard limit of 28,000 newgroups in all versions at this
time. I would think that is as many as anyone would want. What kind
of messages are you getting in the LOG file.

I have not bothered to fetch Full Groups in over a year, simply
because the thing takes up so much space.

I don't have a copy of Outside to test with, so I don't know if its
compatible.

programming books from Abacus and MichTron

Also have a 1040ST that needs a little repair work (bad floppy)
Lastly I have a homebuilt case with 2 hard drives in it for the Atari
series. (1) 30MB Supra and (1) 70MB Seagate(i think)

The 1027 isn't worth much; it's slow and rollers are impossible to find,
even though the output looks pretty good. However, if you're looking for
a letter-quality printer to hook up to the Atari I have just the thing;
an Atari XDM 121 (I think that's the model number). It has the power supply
built in (and a cable to plug it in) and a ribbon included, but no I/O cable.
The best thing is that you can still buy ribbons for it (it's compatible
with some Olivetti ribbon, though I forget exactly which). I'll sell it
for $12 plus whatever it costs to ship it.

> are other machines on which it works...

Well, Terry's descriptions in the beginning of this thread were not
suitable for factual arguments and only raised vague speculations.

Now that we have a sample it becomes clear what the matter is about.
(I can also understand now why he hesitated to make it available
at first - it's certainly not the most aesthetical image, but as
a regular Usenet participant one is used to see pics with much
worse contents ;-).

It seems indeed a cool trick utilizing appropriate interlaced display
modes.
I was able to get an impression of the intended effect on my Falcon
with a 1280*960*16 colors at 63 Hz interlaced display mode.

Regularly I use 1024*768 or 1152*832 resolutions in 16 color mode
with high interlaced frequencies between 85 and 90 Hz. In these
modes one can only see a vague indication of the intended effect,
also in 960*720*256 colors with 78 Hz interlaced. Higher color
modes do not allow interlace on my configuration at all.

Unfortunately, I can't get below the above mentioned extreme mode
with ScreenBlaster on my very broad-band MultiSync monitor, and I
don't have the opportunity to connect to a low-band RGB (TV) monitor
at the moment. I would expect the best results of the intended
effect between 50 and 60 Hz interlace frequency.

I have also noticed a dependence of the intended effect on the
dither mode, especially in the low-color (16 colors) environment.
Only with a decent error diffusion dither mode (I used 1stGuide
with the Floyd-Steinberg default, of course :-) will you see the
effect here. The Ordered Dither mode with the usual Bayer-pattern
only leads to horrible flickering of the *whole* image under these
circumstances.

Regards,
Guido

Thanks John for the information! But one question remain: What is a TT compared to an ST or falcon? I believed that the falcon was the succesor of the ST. The machine I had in the mid late eighties was a 520ST. Wich was a cool machine.

Thanks!

Is it possible to do this on a Falcon, not emulate an Atari, but to
put my games into a ST image, and run them off of my harddrive. It
would be great to pull up a dirctory and have all my games right
there ready to run. No more floppies :')

I've been spending some time over in
news.admin.net-abuse.email -- one of the continuing
concerns in that group is that a "little bit" of spam
always seems to grow into a "whole lot" of spam. Then
it's impossible to stop.

If the list were only active once/day (maybe it could
update while the list owner was at dinner or something),
it would still suit my needs.

That's my $0.02, anyway.

ANyone know what the layout of the .ST files used in PaCifiST is? I know its a logical sector layout, but is it a sector for sector copy of a floppy? What is the sector layout (ie: header bytes, data bytes, etc) of the .ST image and while were at it, what about the floppy drive?

Any info would be appreciated.
Thx.

s> concerns in that group is that a "little bit" of spam
s> always seems to grow into a "whole lot" of spam. Then
s> it's impossible to stop.

I was just checking out the mail from the MagiC list and I didn't see any spam. This is all that's at the bottom of each mail:

-----8<--- cut-here ---8<-----
To unsubscribe from this mailing list, or to change your subscription to digest, go to the ONElist web site, at http://www.onelist.com and select the User Center link from the menu bar on the left.
-----8<--- cut-here ---8<-----

There is nothing extra at the top of the mail. Is that what you're talking about, that you consider spam? That changes slightly from message to message, but it's never over three lines and it always involves their web site. I see no big deal.

s> If the list were only active once/day (maybe it could
s> update while the list owner was at dinner or something),
s> it would still suit my needs.

If you're talking about something like a Net2Net mailing list, I wouldn't be worried about processing the mail. I don't think it would take THAT long. I'm only saying that the list would wait till I (or whoever is running the list) got around to calling my mail server, picking up the mail, running N2N, etc. If I was at work or out of town or whatever, the list would come to a halt. That's what's nice about using a commercial list server.

I can..... If people are willing to connect it i can setup a magic
mailinglist.

If there are more than 10 people to connect i will setup the list..

Just drop me an email.....

I didn't have the related problem. BTW, I retreive in the Nos format
(for Okami) but I doubt it can be the problem.

If you consider to coordinate the efforts in our small Atari world is to
control everything then live alone in your small and independent Atari
world.

> *Does anyone have access to a proper list server (read: one that
> operates without adding junk to every message) who could set up a
> MagiC list?*

Instead to cooperate an to contribute to the list with new ideas, etc...
and as you don't like the way the list was created you consider to
create another one. THIS IS THE COORDINATION WE'RE TALKING ABOUT.

Jospe Rodriguez
MagiC OS mailing list coordinator.

Hi all

Re- apex viewers, the ones i have came with apex intro so could be different.
also i do know that 99% of all ttp applications dont work with lfns at all, i
just either search out a gem based alternative or rename the files to 8+3
temporarily,

the other thing with vfat is that the lfns can sometimes take up more data space than
the actual file, especially in the case of very small gifs,

all my drives are vfat apart from my boot partition, as i dont trust vfat 100%, and
to be honest since i installed the vfat system on my scsi external i have had to
repair it so many times with hd opt2.7,

just do what i do, keep vfat on your drives but just create and name files in the
8+3 standard where possible, it works and isnt tedious unless you start to batch
process stuff

ha ha it's Magic!

There are, wait for it, 65536 different levels....!

Have you got a lifetime to play the game? The levels are worked out
mathematically apparently!

> P. S.
> What happens when you finally reach the end?

Well, you free yourself I suppose. Was it the 8th level on the space
station where you found yourself only to be taken away captured again?

elric (elric@mlink.net) wrote:
: > Are you sure its a 20" monitor? What is the model number on the monitor

: In fact, it is really a 19" inches. Sorry about the mistake. It is a TTM
: 195 with a resolution of 1280X960.

: > and what system is it designed to work with?
: This I don't know. I don't have access to the manual. But I can call my
: friend monday morning to check for the answer.

This is a TT only monitor, I believe it is a TTL type, and plugs into the
TT monitor/VGA port. It will not work on the Falcon or ST. The TT
monochrome from Atari and Moniterm are very similar in function. They
look fantastic for MIDI sequencing and desktop publishing. They are paper
white and high contrast - very easy on the eyes for long term computing.
If you have a TT and prefer resolution to color, this is a terrific
monitor to use.

Pegasus (both DOS and Windows) certainly *does* support UUE (defaults
to it in our copies at work). However Netscape and IE not
understanding one of the major standards for file attachments isn't
much of a surprise, really, is it?

But the spam at the end of each mail isn't the whole story, is it?
There's also the problem of list *users* (as opposed to
administrators) having to register personal details with Onelist,
presumably so they can "target" the adverts. You have to be a Onelist
"member" (ie leave yourself wide open to yet more junk cluttering up
your mailbox) to subscribe to any of their lists.

With a normal list the only details you give are your name and email
address when you subscribe, which is all that's necessary.

None spring to mind, and you might only be able to find old versions
on FTP sites. It's changed a lot over the last few months with lots of
bug-fixes and extras so you really need the latest version.

Looks like the author is rearranging his site at the moment as the
Okami page has sprouted a background picture since I last looked at
it, so it might be worth checking again in a few days.

I'll mail the author about the download problem anyway.

Cheers,
John

No I have not joined the list. To do so involves registering personal details with Onelist and agreeing to their terms and conditions, with which I do not agree (and yes I did get that far: I stopped at the point where to progress I had to click on the "I agree" link). Which is part of my point (see also my other message in this thread). By registering for this list you are agreeing to receive advertising and supplying details to help the organisers target that advertising.

>> >If any user wants to create a new mailing list, please, tell us

Coordination/cooperation is not a problem. People setting themselves up as coordinators and ordering the rest of us about *is*. This may simply be a language problem, in which case please accept my apologies, but your original statement reads as if you're expecting everyone to ask your permission before setting anything else up so *you* can decide if it's OK. Sorry, no deal.

>> *Does anyone have access to a proper list server (read: one that
>> operates without adding junk to every message) who could set up a

>
>Instead to cooperate an to contribute to the list with new ideas, etc...

As I said in my original message, the idea of having a MagiC list is a good one.

>and as you don't like the way the list was created

No I don't: I'm not happy about yet more advertising for the reasons stated in my original message. I'm not happy about adverts attached to messages and I'm not happy about having to register details to help the advertisers.

>you consider to
>create another one. THIS IS THE COORDINATION WE'RE TALKING ABOUT.

And who are you to dictate we all join your list if we're not happy with the terms and conditions required to join it?

Mike - depends on the program. The company I work for uses "GroupWise"
and a CompuServe server for all of our company e-mail. I can encode and mail
to myself or others from home (with my TT) with no problem using either UUE or
MIME (from Newsie 0.88). Within GroupWise there is a "Preferences" (sound familiar :))
dialog and with in that you will find a size (limits) section that
allows you to limit the size of an e-mail or file attachment that the
program will receive. If the file is larger than the pre-set, you will
only get the header. Keeps people in our home office (NY) from
cluttering up my mail box with "dancing baloney". Additionally some of
the on-line mail services, Juno is one I know for sure, have an automatic limit
for any incoming mail (in Juno's case it is 64K).

In addition I have sent encoded (UUE and MIME) to friends with PC's with
no problems using Newsie.

One thing you might try is if the problem presists, reload
Newsie.PRG/RSC. I have found that sometimes it seems the working version
of the program gets corrupted and starts causing all kinds of strange
little quirks. Reloading the main program and rsc file from my download archive
solves this.
the zip.

I would welcome dropping GIF support altogether by the major Browser vendors!
This would drastically accelerate the transition to the more reasonable PNG
format. Website maintainers could simply apply an automatic conversion
process utilizing the gif2png utility.
The transition will take place anyway as time goes on, but too slow for my
taste. I prefer using reasonable solutions as early as possible instead of
waiting on careless people to take it over.

Most importantly, make sure you're running the right NOVA binaries. Have you confirmed that the NOVA box has a Mach64, Mach32, or ET4000 chipset? This is important to know because if you're using the wrong binaries you'll have nothing but problems.

The files emulator.prg and menu.prg should be the first to auto-boot (at least I don't boot anything else before them, except the hard-disk driver). The emulator.prg is required so one can see and use menu.prg (remember, the VDI driver hasn't been installed at this point, so this simple emulator must be used to see what's on the screen). Because you're getting a black screen, it sounds like emulator.prg isn't installed correctly or is simply the wrong binary for your NOVA hardware. Are you sure menu.prg is really there even though you can't see it? In other words, does holding down the two shift keys (to summon menu.prg) actually pause the boot process?

Try placing your boot manager (XBoot, whatever) just after menu.prg. If your boot manager appears, then at least you know emulator.prg is

working. If you get this far, then it's from here that the VDI driver (sta_vdi.prg) can be booted from your boot manager. If everything up to this point fails, you're probably using the wrong NOVA binaries.

> I seen a VMG.PRG, but without doc, it's difficult to use it.
> Do you have any explications for this programm.

The VMG (Video Mode Generator) is used to optimize the NOVA card to your particular monitor (to get the best display from it). Enter your monitor's maximum vertical, horizontal, and pixel frequencies then 'save parameters' (to vmg.inf). You'll have to check your monitor's manual to see what these maximums are. WARNING: FAILURE TO INPUT THE CORRECT MAXIMUMS MAY DESTROY YOUR MONITOR! If the VMG scares you (don't let it), look for a folder called 'monitors', which contains some standard resolution libraries (*.bib) that can be used without having to make or modify one with the VMG. For instance, bis65.bib can be used with a monitor that has a maximum pixel frequency (video bandwidth) of 65 MHz. This standard *bib file worked on my NEC MultiSync right away, but later I used the VMG to create a custom, optimized library. Just copy bis65.bib (or whatever file is applicable to your monitor) to the auto folder and rename it to sta_vdi.bib. But make sure you know that the *.bib file used will not push your monitor beyond its hardware limits: I started off with bis65.bib because I knew my monitor could handle that frequency (its maximum is 75 MHz). If I remember correctly, the default sta_vdi.bib and vmg.inf files have 'safe' monitor values to start off with. But worry about the VMG later, until you get emulator.prg and menu.prg working.

BTW, say hello to Jo for me ;-)

>leading into a pair of active speakers
>
>if i connect the two with a "y" adaptor the falcon grabs all the power.
>i imagin i need to make up a lead with some resistors or somthing
>has anyone got this info

Why don't you connect the CD's audio output to the Falcon's input and run a program that patches the audio directly from in to out? Then you can listen to both of them... I don't remember the name of the program, but I believe it's AUDTHRU or something like that and it should be located in the AUTO folder. If there is need for it, I can try to find it (I believe I have it somewhere...).

Best regards,

> by any reasonable definition of the word.

I think Guido's feelings about GIF are also based on -- besides the format's limitations -- the licensing that must be paid by developers to Unisys for using their LZW compression. For instance, you won't find the GIF module in GEM-View's archive anymore because of these legalities. I believe freeware programs are exempt from this royalty, though (shareware being considered commercial in Unisys' eyes). (I'm sure someone will correct me if I'm wrong here.)

GIF is far from obsolete, but PNG is better and royalty-free.

BTW, I had a GIF come in that wouldn't display at all in CAB (nothing on my TT would). Ends up it was a proprietary 24-bit GIF (a collector's item).

```
The P drive limit is hardcoded in GemDos. You cannot have drive letters
after P (except U, which is a virtual drive under MiNT)

Get good old AHDI 6.06 from most FTP sites, or HD Driver, from an Atari
dealer, which is sooooo much better.

>Advice as to what I need and where to get it from? I need to wipe the odd
>Partition and juggle same. There is something called BIGDOS on the HD

BigDos allows you to format your drives as PC compatible.

Cheers,
Nick

Not worthless, since 1Mb is often sufficient for most applications
anyway, but harder to expand than, say, an STE.

Before upgrading, ask yourself why you want to upgrade. If you are only
playing games and typing a few letters, then your STF will be enough.

Cheers,
Nick

The GIF had embedded text comments, including a URL explaining this new so-called GIF extension. I've since lost this 'special' GIF and the URL (which I did visit). If you're interested, try a search for 'true color GIF' or '24-bit GIF' (or something along those lines). More a novelty than anything else.

Thanks for the explanation (and Chris Gray's). I'll reverse what I
originally said: "...a failure of that particular http server with the
cab.ovl." ;-). But as Terry stated, CAB 2.7 clears its image cache during
an online reload, something unrelated to the ovl.

What about cookies? On one site I can't get them to work, yet on another
I can. This is with the CAB 2.7 demo and cab.ovl 1.2904.

1607. REQ : Steinberg Pro 24

Newsgroup: comp.sys.atari.st
Date: 1998-06-29 00:00:00 UTC
From: Harold <goosiegand@hotmail.com>
Message-ID: <35975B3C.F7B69B95@hotmail.com>
Source record: 98176

Hi, A few years ago I used an Atari ST1040 and Pro 24 to compose all my midi files. Recently, I turned to the IBM to continue my MIDI editing. However, I recently found an ATARI emulator on the net and found that I can now run my old ATARI programs. However, when I run PRO24 it crashes because it is looking for the key. Does anybody have a hacked copy of PRO24 that doesent need the key that will run on the PC. The main reason for my request is that I saved a lot of my old files on floppies as .sng and would now like to transfer them over to MIDI files via the PC and Steinberg.

If anyone has the file can they post it to this newsgroup or email it to :

chrisj@mail.wit-tafe.nsw.edu.au

What about just load the file in the clipboard then past it in the
dialog box ?

>John
>

Hi John,

I just checked my full newsgroups list in QED, it tells me it's got 27,362 lines and runs from 3b.config to zz.unity.netlink.
Fetched that one with the first version of Newsie I started with (0.80 or 0.82, I'm not sure).
Never bothered to update it really, but maybe the 28,000 lines limit IS now becoming a bit low, since there's only additions to the list...

Talking about the UUE stuff, I never had problems sending UUE coded attachments to PC users. The only problem I had was Newsie won't allow me to create more than 1 (one) attachment in one single program run. It means I must quit and start Newsie again (and again etc) to prepare UUE attachments if I want to do that in more than 1 message....
I believe it was Roger Cain experiencing the same problem...?

Drag-and-drop doesn't work with AltaVista and CAB, which logically assumes what's dropped into its window is another resource to open. The clipboard is supported in forms, though, and this is what they recommend to use. In CAB I tried pasting (ctrl-c) a small German-language text file but it would translate only the first few lines; and to see the results I had to reload the page. Otherwise, besides apparent size restrictions, the pasted translations looked great (three lines at a time).

You can still buy Pro24 from Atari dealers. Giving away pirate software
would not be fair to these people who still struggle to support the
software.

Here in France, there's a dealer who has a whole stock of Pro24 that
he's selling 300FF (UKP30, US$15) or giving away with used 1040 systems
as a basic sequencing package.

BTW, Pro24 later became Cubase, so Cubase for PC can read .SNG files
(well, I think).

The following is For Sale (Long Live Atari!):

I'm looking for Best Offer and Pickup Only. I'm in the process of moving
and I don't have time to ship. I live in the Chicago, IL area.

Atari TT with internal HD (40 Meg, I think) It comes with the PTC1426 monitor
and 8 Megs of ram (4 ST, 4 TT) and an external hard drive which I believe is
400 Meg. I will also have a 24-pin dot matrix Toshiba printer for sale
and loads of ST and TT software. I also have a Migraph Hand scanner and scanner
try which can be used with a ST or TT

Chuck

Just some questions for all the Atari users out there:

1. If Atari came out with a new computer system would you buy it?

2. If the system were not compatible with the ST would you still
consider it?

3. Would you buy the new computer if offered a discount or rebate for
your ST?

Thanks

>
> That's not true at all. The FidoNet standard allows for unformatted
> paragraphs and any decent reader (such as LED) automatically wraps and
> reformats the lines as necessary both when reading and when quoting.

So how does it handle quoting ? Note I was talking about quoted stuff.
A two hundred character line will be formatted to two lines in a window
that is 120 characters wide, so two quote characters will be inserted
into the line. Now, the two hundred and two character line (quoted) is
displayed in an 80 character window, where three lines will be needed
(but there are only two quote characters ? And where do you think, will
the second one be ? Right in the middle of the second line !). So the
system breaks down anyway. That was what I was saying.

Simply allowing endless lines for automatic formatting is just too simple
a "solution" in order to work. You'll need to do a bit more, like including
marking information into the text, which will lead to an entirely different
text format. Simply allowing endless lines is the lazy's person method of
only going half the way to the goal. Half the way means, not working in
all cases, but leading to trouble for some other people. So all I can say
is thanks, but no, thanks, to such an approach. If you wanna go the full way,
I'll join you.

Cheers Peter

You can use STinG even with TOS 1.0, although configuring is a bit tricky.
I'd never recommend it, though, as that TOS version is so ridiculously
bug-ridden that you spend the larger part of your time fighting against
bugs rather than working with the machine.

On TOS 1.0 machines HSMODEM must must must be installed. There is no way
playing with STinG without HSMODEM.

Ooops, I'm sorry. Ya know, these names are really very very similar ;-)

The Resolver is a piece of software that utilizes STinG calls to find out
about IP addresses. Essentially, any program can do the same (it's not even
much code), and check for keys or whatever during the action.

Still saying the resolver blocks the entire system is stupid nonsense. Even
on single-tasking TOS, accessories *work* while the main program does a
resolve action (or vice versa).

No worries.

If you'd said there's sometimes weird stuff going on with the CAB.OVL, I'd
probably agree. Although it's become much better with the recent versions,
there are still a few quirks left that have been left uncorrected for some
versions now.

I'm not sure if I should mention it, but in the STiK beta list someone has
come up with an alternative CAB.OVL, which avoids those quirks. But it's
still early beta or even alpha code, so don't rely on it for the next, say,
two months ;-)

Note that is a different situation than the one that was discussed earlier.
This "hanging" is entirely due to CAB.OVL code, as the resolver has long done
it's work and returned to the OVL code. At that stage, only non-blocking
calls of STinG are called.

Use a late version of Dan Ackermans CAB.OVL. Older versions do not support
cookies. Still you can have trouble with stupid servers, for those cases
edit CAB_OVL.CFG to make the OVL pretend to be Mozilla.

If you've learnt to program C, it's a one-liner to switch it on. ;-)

Later on there will be a program that can run from the AUTO folder and that
does all the configuration work that hitherto was done by the CPXs.

>
> Peter, what do you think of this ?

Not good. The Dialer purposely acts *only* on the one port which is going
to provide another connection to the machine. The activation is a global
flag that effects the entire machine. I will not allow terminating or
suddenly allowing traffic though other ports which the Dialer is not supposed
to touch, but that might be in use by STinG (note STinG is a LAN package,
that supports usage of more than just one port).

If one does not want to keep XControl in the system, he can rename it to
XCONTROL.PRG, and start it after the desktop came up. This way, after it's
window is closed, it will terminate again and get removed from memory.

Huh ? Both AtariIRC and FracIRC (the latter is my favourite) run on
STinG, which does work with TOS 1.02 (needs HSMODEM). For IRC, you'll
need 1 MB at least.

Dan's CAB.OVL actually did authentication earlier than the I-Connect one did it. The sad thing however is that he broke it in later versions.

People needing it should look out for CAB.OVL V1.270x. It can happen that CAB says "authentication failed", in that case just try again and it'll work the second time.

Ok, the manual ... ;-)

> I'll save you some time. Do you mean to say that only Andreas wrote MagxDesk
> and this is what gets added to by WDialog? In that case, you may have a
> point...

My understanding is that MagiC provides a fair bit of extra system calls
for things like dialogs in windows etc. In order to make these things
available to singleTOS machines the Behnes did WDIALOG. However, they
added things to WDIALOG that cannot be found in MagiC, IIRC related to
printing for instance, that is why installing it even under MagiC still
makes sense.

AFAIK MagiC (the binary) is entirely by Kromke. Same for MagXDesk.

Control your line length when using ASH Emailer !!!

The IP address transferred by the ISP is in no way related to DHCP. The
protocol involved is purely PPP. DHCP is not used.

As for Windows this is not needed, it is likely that the ISP provides those
as a PPP option. In that case STinG will fetch the DNS addresses automatically.

> BTW; I remember someone saying that PC's and win 95 were easy to set up

Those ISPs often provide the DNS too as a PPP option, for those you won't
need to bother. Just try it, delete the entry in your DIAL.SCR

That's not very surprising. The "Hannet" is a local Hannover/Germany non profit
computer organisation, and they run a set of newsgroups, including the one
mentioned above. As being local, it won't be available on any news server that's
not located in northern germany. The group's language is german, too.

Well..... Then it's not a full groupls listing then, is it. :-/
If you keep this limit, then better change it to limited listing or
something more accurate (and honest) so users know they are not getting
the complete list from their ISP.

From my perspective, of trying to find out information using the
Internet, it is not a question of how many newsgroups a person would
want, but a question of finding the newsgroup you need. If a person
needs to get information on XXXXXXX and can't find the newsgroup using
Newsie's full group list, but then goes to his/her buddy's Windows
machine, and finds thousands more newsgroups listed, including the
desired one, what are they going to think about your program and the
Atari platform? They might just start thinking about buying PC if they
haven't already.

Just out of curiosity, why the limit anyway?

>I don't have a copy of Outside to test with, so I don't know if its
>compatible.
>

Given the above limit, trying outside is a moot point. My current Newsie
fullgroups list is 27,946 lines long, just 54 lower than your limit. And
it's set to run in ST RAM, just 10 megs. So the only thing Outside would
do is possibly allow Edith to sort the group listing from my ISP. Which
is pointless, as the listing at the ISP changes and grows daily as users
learn of and request additional newsgroups.

I'm running Edith as a desk acc, and I don't know how accessories
interact with ST and TT ram. I believe I read somewhere that the
program flag settings do not work for desk accessories.

4 Meg - $120

Set of 4 New 1 Meg 30 Pin SiMMs - $12

2 ST Xtra RAM Boards with Copy of Instructions (AS-IS) - $40
Board takes RAM listed above.

Mega STe Motherboard with 4 Megs of RAM and Power Supply - $110
(These boards were saved from the crusher! Might be able to get a limited
supply of TOS 2.05)

Double Sided/Double Density Atari Disk Drive - $35
(STE Style, small Rhombus Eject Button)

Mega ST or STe Keyboard - $75

New UK Atari TT Keyboard - $100

New Atari Mouse - $30
Used Atari Mouse - $15
Beetle Mouse - $25

PS/2 or Serial Beetle Mouse - $25

Ultimate Cubase CD from System Solutions - $30 (4 Left)

Toad's Atari Compendium & Suzy B's Software Treasury (3 CDs Total)
$24 shipped to US & Canadian Destinations, $20 + shipping elsewhere

Atari 7800 Joysticks LOOSE & Working
$7.00 each, $5.00 each in quantities of 5 or more

Atari Lynx Games
$10.00 each, $8.00 each in quantities of 5 or more
See web site for list.

Atari Portfolio PC Card Drive - $30
Atari Portfolio Parallel Port Interface - $25
Atari Portfolio 64k Flash Card (Disk) - $29 (3 Left)
Atari Portfolio Case - $20 (1 Left)

Spectre GCR without MAC ROMS - $25
(Inquire about Mac ROMS)

Eureka Clock Cartridge - $7
Pyramid Monitor Master - $5

STf/Falcon 3 inch Joystick Extension Cables - $1
(Make access to under keyboard ports easier)

Atari ST Custom Chips - $1

Also have 1 Atari Laser Printer, good only for parts. Would be very
costly to ship. Also have various Atari Monitor parts.

Source record: 98302

I just picked up a 520ST (and a 1040ST) with color Monitors for both. The problem is that the 520ST only displays a white screen when turned on. Anybody know what to look for or how I can fix this. The 1040ST works great.

Thanks, Corey

Mmm .. I just looked at the babelfish page and noted that it said you could 'paste' text into the box. I tried to do it by dragging&dropping a file onto the box but this just caused CAB to display the file as though it was a hyperlink i.e. I lost the original Alta Vista page so could not even attempt to start the translation.

Perhaps this is something which CAB does not understand - pasting into a displayed dialogue box?

How would I use a clipboard copy to paste it, Pascal?

>Cattamaran 48 MHZ accel., NEC CDROM, and std vga monitor.

That's a scsi based removeable hard drive. Just plug it into
your ICD Fa-ST box (if it has a scsi out - a lot of them
didn't), or plug it into your TTs scsi out port - probably
easier. You will need to make sure that terminations are
taken care of (only last device on scsi chain) and that you
are using a unique scsi id for the syquest (ie one not used
by another device on the chain.)

I assume you are using icd software - so it should recognize
the syquest as a removable on boot up. (Boot up with a
cartridge inserted in the drive and spun up.)

>> this time. I would think that is as many as anyone would want.
w>
w> Well..... Then it's not a full groupls listing then, is it.

Of course not. Geez, it's not like you're going to use 28,000 newsgroups. The idea is not to just get a bunch of them and then choose from that. The idea is to see ALL that is available and then choose from that. Anything less is NOT "as many as anyone would want." If you can't see everything available, then there's a very good chance you're missing out on something useful.

I recommend you give NEWSwatch a try. It will download your entire listing, no matter how large. My ISP offers four different news servers. At least one of them has over 33,000 newsgroups. The only drawback with NEWSwatch is it won't sort your groups for you, but QED will take care of that (though it may take a little while). Or you could probably use one of the TTP sorters to do it.

If you like NEWSie, you can still use it for whatever you're using it for, and just use NEWSwatch for downloading newsgroup lists. But NEWSwatch makes a very nice companion to offline readers.

I've had that happen too. UUD has also given me the "System Halted" message
many times when encountering a corrupted UUE file (not necessarily from
NEWSie, but from the desktop). Since MUNPACK handles UUE files, the only
reason to use UUD for extracting UUE files is if long filenames are important
to you (they are to me). UUD is the only encoder/decoder I know of that
supports LFNs, unfortunately.

> do the transfer?

I copied a text file from qed to the Atari clipboard using ctrl-c, placed the cursor into AltaVista's translate box, then pasted the text with ctrl-v. After pasting, the text didn't actually display in the box, but the cursor within the box moved to the far right, so I knew something was there. When I clicked translate, nothing appeared until a reload was performed, in which case only the first three lines of the pasted text file were translated.

To translate the entire text file, I had to convert it to threadbare HTML, put it online and enter the URL (easy enough to do while multitasking CAB, aFTP and qed). The only drawback was that since the text file used the Atari character set, words with foreign characters didn't get translated. These foreign characters would first have to be converted to named HTML entities (with Home Page Penguin or something similar).

I wonder if a different AES were used, would CAB handle more than three lines of pasted text? (I was using Geneva.) Or is this one of those cab.ovl things. Hmmmm...

Actually, Babelfish itself is limiting the length of the text it
translates. I don't know why it is so parsimonious when you paste text in
for translation considering how generous it is for URL links (although
even so, most web pages I've fed it were longer than Babelfish's atention
span and had chunks at the end untranslated), but that's the way it is.

Hello,

in article <6n8km0kd1@roch.zetnet.co.uk>
Roger Cain wrote:

> How would I use a clipboard copy to paste it, Pascal?

Well it's just an idea, I've not try yet but: load the text in an editor
(Everest, Qed...), cut it or the part you want to send (to the clipboard).
You can also do te same by just copying the file as 'scrap.txt' in
c:\clipbrd or what ever you call it. I suppose the dialog on AltaVista
just reacts as all text fields, so '^V' and there it (should) go.

Bye,
/Pascal/

>or: appears not to exist.

Pardon?

Do you mean the site for registering for the list in question (which does, but is nothing to do with me) or whalley.demon.co.uk (which does: it's this here STE, which exists in as much as anything does in the perceived universe :-)).

Demon give all their subscribers individual host names with fixed IP addresses (hence no limit to the number of different mailboxes/ usernames you can have). You will not be able to ping/finger my machine unless I'm online at the time of course, as I have a dial-up connection. You should, however, be able to do a DNS lookup on the name, likewise with my virtual web host www.demon.co.uk (which is online all the time, naturally, except when Demon's server is down for some reason).

All the sig means is that if you send mail to news@whalley.demon.co.uk the mail will be rejected as an anti-spam measure. People (as opposed to spam-bots) are capable of using my real address which is john (at) whalley.demon.co.uk.

news@whalley.demon.co.uk is a valid address, however.

Thanks, but I'll see if anything comes of the advertising-free list
before exploring Onelist any further.

>> And who are you to dictate we all join your list if we're not happy
>> with the terms and conditions required to join it?
>
>I don't dictate anything. I just want to give solutions on our small
>Atari community. Do you think it's logical to have3 or 4 mailing list
>talking about the same topic?

No I don't. It might have been a more sensible course to ask around
for alternatives in here before going for a commercial solution with
enforced advertising as the price.

>If you have any solution, please tell us we're looking for solutions.

Rick Speelman has offered to set up an advertising-free list if more
than 10 people sign up for it. Sounds like a solution to me, and worth
a try. For anyone who missed his message, email him on
gatekeeper (at) nightshift.demon.nl if you are interested.

Cheers,
John

THE COMPUTER DUNGEON is beginning the process of moving to a
new location and from now until August 1st is having its first (and hopefully
last) MOVING SALE!

Right now, you can save 20% to 25% of the listed prices of ST/Falcon
software, ST/Falcon accessories, video game cartridges-systems-accessories,
and much more!

(NOTE: Shareware games, select hardware items, and magazines excluded
from discounts)

Just visit our website, look over our product list, select the item/s you want,
give us a call to place your order, and we'll take 20% off the total price of
your
selections.

AND.... if you order totals $75.00 or more we'll take an additional 5% off the
purchase price making your total discount 25%!

You save money, we save our backs!

Visit our website at: http://www.mcs.net/~isis/dungeon/dungeon.htm
or call (708) 547-7085 Mon-Fri 10am to 5:30pm CST for more information or
to place an order.

Thanks for taking the time to read this and we look forward to helping you with
all your Atari needs.

1691. SuperCharger PC emulator FT!

Newsgroup: comp.sys.atari.st
Date: 1998-06-29 00:00:00 UTC
From: Mike Morais <siaromm@genie.idt.net>
Message-ID: <6n9j86$7oa@nnrp1.farm.idt.net>
Source record: 98338

I've got a SuperCharger PC emulator that I'd like to trade for various items.

It's an external XT (8088) emulator that connects to an ST/TT through the DMA port. I've got all the cables, documentation and software (includes MS-DOS 4.01) that came with the unit. I may even have the original box packed away - I'll have to check for that.

I'm interested in trading it for any (or combinations) of the following:

Jaguar Games: Fever Pitch Soccer, Brain Dead 13 CD, Rayman, Bubsy, Dragon:The Bruce Lee Story, Dino Dudes, Syndicate, Raiden.

Lynx Games: Awesome Golf, Bill & Ted, European Soccer Challenge, Casino, Super Asteroids/Missle Command, Xenophobe, Desert Strike, T-Tris.

or a 33,600 bps modem.

If you're interested (or have any questions), send me an offer through Email at m.morais@genie.com (ignore the address above!!!).

Mister E...

Aren't they actually wanting you to buy the program that allows you to do it on your own (Windows) computer? That would explain the limitations. They want to give you a taste of it, without destroying the market potential of their software. Kind of like a demo.

It won't happen because Atari no longer exists. There is no such company
as Atari Corporation. The End. The NAME belongs to a GAME SOFTWARE
company, that is part of a major TOY company. I see no logical reason
for these people to start developing a computer that would have to
compete against Intel and Microsloft, and then sell it under the Atari
name instead of their own name.

>
> 2. If the system were not compatible with the ST would you still
> consider it?

Are you talking about a non-Atari computer (see above) that would be
non-Atari compatible. I can already see quite a few examples around in
the shops today.

>
> 3. Would you buy the new computer if offered a discount or rebate for
> your ST?

Don't quote me on this, but I seem to remember the V30 as being an 8086
(PC-XT) compatible chip, whereas the V20 was an 8088 (PC). They were
often used in portable because of their lower power consumption.

That's a reasonable enough explanation...

> XCONTROL.PRG, and start it after the desktop came up. This way, after it's
> window is closed, it will terminate again and get removed from memory.

I wasn't aware of this solution. But why should the user have to launch
XControl, then open the STING.CPX, then select active, then Quit.

Maybe an "AutoActive=Yes" option could be included in the STING.INF file
or elsewhere that would avoid the above tedious manipulations. I'm
considering the case of users who have STING.PRX in their auto folder,
and only activate it when they want to go online.

It just seems to me that the whole CPX+Xcontrol combination is a bit
"heavy" for just activating one tick box. I've seen in another post that
you are working on the "CPX issue", so I suppose you're already aware of
all this and doing your best to get it better anyway.

Cheers,
Nick

> Does anyone know where I can get an ICD "The Link" cable so I can hook
> up a SCSI drive to my Mega2?
>

Depending on your location in the world, that you omitted to mention,
you can get SCSI host adapters either from ICD in the US, from Titan,
TUS or System Solutions in the UK, Terre du Milieu or Centek in France,
MABN in the Netherlands, Woller in Germany and probably quite a few
other places. The ICD is not the only one, there's also the Link'97 or
the Top Link, which do more or less the same but are from different
companies.

> Your help is appreciated.
>
> Andrew
> sirandrew@sprintmail.com
>
> Does anyone know how to hook up an IDE HardDrive to the ST?

For a ST, there was once a pretty complicated and obscure DIY kit, that
was available in Germany. An STE, on the other hand, can take an IDE
interface built in the UK by TUS.

Cheers,
Nick

I regard KingCon as CON: replacement, although Kingcon does not implement
all the functionality CON: has (ksh likes crashing if run under KCON: i.e)

> Some people use WShell and there's ZShell out there somewhere. I think

WShell is impossible to get (and really fun to configure as I have heard)
and ZShell I have never heard of..

> they both support nameless pipes and all that fancy shit.

You do not need KingCon: to have nameles pipes.

1702. Misc ST Hardware + Software FS

Newsgroup: comp.sys.atari.st
Date: 1998-06-30 00:00:00 UTC
From: aa778@cleveland.Freenet.Edu
Message-ID: <6nb11m$c5h$1@pale-rider.INS.CWRU.Edu>
Source record: 97899

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. E-Mail me or call me at
440-729-0761 evenings EST. I am also open to trade offers.
E-mail me your list.

HARDWARE

Atari STacy2 portable ST computer.
2 Meg RAM and 20 Meg internal hard drive
ICD Adspeed 16mhz CPU upgrade. Switchable between 8/16mhz
640x400 mono screen that is in good shape
720k internal floppy drive
Only real blemish is the "3" key is fussy at times
Ports for external mono and color monitors, MIDI, mouse, ASCI, serial,
parallel, and floppy drive
Comes with power supply and power cable
Asking $350 shipped anywhere continental USA.

Falcon Speed by Sack Electronic
Intel 286-16mhz IBM processor board for the Atari Falcon computer
Run DOS and Windows 3.1 programs on your Falcon
Norton SI Factor of 12
Sound Support
Up to 8 Meg of IBM RAM
VGA and SVGA video modes 640x480, 800x600, and 1024x768 under Windows 3.1
Switch back and forth between TOS and DOS modes $100.00

Syquest 5 1/4" 44 meg removeable cartridges. Will be HDX formated and
verified good. each $15.00

Atari SC1224 Color Monitor. Unit is in perfect working order.
Comes with power cable. $50.00

Atari SM124 Mono Monitor. Unit is in perfect working order.
Comes with power cable. $45.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $50.00

Supra 2400 baud external modem. No power supply. $3.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 as a stand alone fax machine.
Comes with special fax modem, diskettes, and manual. $35.00

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

Conquest of Camelot by Sierra. Complete with box, docs, and disks $9.00

Gold Rush by Sierra. Complete with box, docs, and disks $9.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $10.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $15.00

MISC SOFTWARE

Moving Pixels CD-ROM. This CD-ROM has Tony Barker's programs
and source code from all the programs he ever wrote for the Atari.
Includes programs like Atax, Brushworks TT, MIDI Battle, Offical (The
official Falcon Demo used by Atari), Tina (The 70 meg Tina Turner TV
comercial), TT Wars (The Star Wars Demo) $10.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $5.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

I had a similar experience with a document yesterday. It accepted the
whole document, but only translated a paragraph at a time, so I had to
cut and paste from one window with the german, into babelfish, and back
into a blank page with the english. The usefulness was really limited.
It really hacked up the language. I had to end up dragging out the old
college German dictionary and do it the old fashioned way.

The V30 also tricks Windows 3.1 into thinking it is a 286, so I had it
running under CGA emulation on the TT. Pretty quick because of the TT
video speed.

Hi, why are you aking for this stuff??? It is normal logical sequence of
sectors on the disk.
Anyway, We wrote a programm, that handle these files pretty good just see
our page (JAY MSA).

PR> DIAL.SCR

Yeah, my ISP provides (and recommends) a dynamic DNS address. Both STinG and
PPP-Connect handle it. However, the ISP also provides primary and secondary
DNS addresses for those that have trouble, and in fact, I just switched over
to them, because I was getting way too many delays resolving hosts. I no
longer have the problem since making the switch.

Re: "ASH Emailer (Was: Re: Falcon 030 and Scanners)", Peter Rottengatter scribbled the following on 29 Jun 98 @ 22:14:36:

PR> outrider@lvdi.net (Terry May) writes:
>>
>> That's not true at all. The FidoNet standard allows for
>> unformatted paragraphs and any decent reader (such as LED)
>> automatically wraps and reformats the lines as necessary both
>> when reading and when quoting.
PR>
PR> So how does it handle quoting ?

It automatically formats paragraphs/long lines for quoting. I have my editor window set at 70 characters. A 200 character line would be reformatted into probably three lines (depending on how many quote characters are needed), with the quote characters at the beginning of each line. It will even reformat an entire paragraph of quoted text, if you want to clean it up, to make it look neater. It automatically keeps track of the needed quote characters for each line added or removed.

PR> So the system breaks down anyway. That was what I was saying.

But you were wrong. :^)

PR> Simply allowing endless lines for automatic formatting is just
PR> too simple a "solution" in order to work.

It works just fine in FidoNet with a good reader, such as LED. And I don't mean just endless lines, but PARAGRAPHS. As I said in another message, long individual lines are no good. LED will still handle them (including all necessary quoting), but it will look a bit messy with the wrapping of different line lengths. Paragraphs is the way to go.

PR> You'll need to do a bit more, like including marking information
PR> into the text, which will lead to an entirely different text
PR> format.

You already have information marked into the text. It's called a CR/LF. You use them at the end of lines you don't want reformatted and don't use them in paragraphs, so your paragraphs can be reformatted to fit the remote's screen.

PR> Simply allowing endless lines is the lazy's person method of
PR> only
PR> going half the way to the goal.

Lazy or not, it works.

PR> Half the way means, not working in *all* cases, but leading to
PR> trouble for some other people.

Only people with poor readers, and that's going to be the case no matter what you come up with. The truly lazy way is the way it is now, where you depend on every one of millions of users to format their messages the proper way.

BTW, welcome back. :^)

unfortunately no. there is a english or french demo of CD-Writer
though.
not much help though is it.

yes.
a possibility is that your drive heads in the Atari (or PC) have
become
misaligned. so that only disks formatted on that drive will be read by
that drive. yuck!
are disks formatted on the Atari able to be read by the IBM?
check disks formatted on either machine on a third machine.

another option is the null modem serial cable, and using a telecomms
program at both ends to transfer files.

There'a an Atari program called 'E-Copy'

I use this to format to DOS standards with no problems. I can then read &
write using both machines.

try a CLI, and copy all your files to one file.
check the CLI for syntax.
maybe: copy c:\whyme.txt whoknows.txt Isee.txt c:\total.asc
you just have to type in the name of the files, or try
copy c:*.txt c:\total.txt

Phantom wrote:

Right. I managed to work out the technique. After pasting I found the
text by shifting the cursor around. There was only about 3 lines of it
there so it's no wonder that's all that comes back!

For some reason I failed to get a translation back but I noticed that
CAB had opened another browser window. Had a look in the previous
window and it wasn't there either. Hmm ... I must have got things in a
twist somewhere as it obviously works in its own limited way for you.
More fiddling around required :-)

>To translate the entire text file, I had to convert it to threadbare
>HTML, put it online and enter the URL (easy enough to do while

Ach! Yes. Nuisance.

>I wonder if a different AES were used, would CAB handle more than three
>lines of pasted text? (I was using Geneva.) Or is this one of those
>cab.ovl things. Hmmmm...

Hmm, indeed. The CNTL-V is an AES function, isn't it? And it works
fine in other apps. (I am using the Magic AES, BTW).

So the finger points at either CAB or, maybe, at the design of
Babelfish's form. I'm not very familiar with HTML but I guess there is
a way to control the input to form fields. Must have a look at the
source of the Babelfish page.

Try just once more.

:)

Use only Double Sided Double Density Disks, and Format ONLY to DOS.) ProDos
is something else entirely.)

If that doesn't work then either your Mac or Atari drives are out of
alignment. Any problems with either drive reading commercial floppies?

You could download a demo of Magic!Mac, the ST emulator for Macintosh, and
use it to access the Atari floppies directly. Sometimes this works,
sometimes not (probably not if either of the drives are out...)

If all else fails - and your Atari drive is out, a new drive for the Atari
may not read the old disks!
Consider plugging your modem into the Atari and mailing the files to
yourself.

Incidentally, Cubase Mac will read Atari ARR's and SNG's too...!

After clicking 'translate', the next page has to be reloaded to see the
results.

> Hmm, indeed. The CNTL-V is an AES function, isn't it? And it works

No, I didn't mean the key-combination to use: I was curious if a
different AES would allow more lines to be pasted and, most
importantly, held in a form like this. Ends up it's just a forced
limitation of AltaVista.

From: outrider@lvdi.net
Message-ID: <4204_outrider@lvdi.net>
Source record: 97940

I figured I'd give Okami a try, so I downloaded the latest version and have been playing with it today. For the most part, I like it so far. Despite all the configs you have to manually edit, it was fairly easy to configure (at least for a seasoned vet like me ;).

Unfortunately, I am having a few problems with it, not the least of which is getting it to work with QED for posting messages. I've tried everything I can think of, but QED cannot find the message it's supposed to be editing. Can someone please post a working QED command line?

Also, I can't read some of my message groups. They show up in the group list, with their number of messages, etc., but when I try to open them up, I get an alert telling me it can't open the group because it doesn't exist. Any ideas on this one? It's happening only on my alt. groups, but that could be a coincidence.

And in the config file is a config statement to turn on or off crosspost handling. It says to see docs for further info. However, I can't find anything in any of the docs/manuals. What exactly does this switch do?

And finally, is there any way to save the message window position? I know you can adjust the size, but it's still placed all the way to the upper-left corner, which presents a little bit of a problem on my overscan display. (Yes, I've adjusted it as best as I can.)

> n> set up an advert-free list.
>
>Is that a list with a permanent connection?

Nope, apparently he uses net2net for his BBS and it connects twice a
day. So not as immediate as a permanent connection.

OTOH I (like many of us, possibly most of us) only have a dialup
connection too and generally check for mail and news once or twice a
day (sometimes not even that often) so for me this isn't much of an
issue.

If you want immediate responses you're probably better off using IRC
or some other chat medium designed for that sort of communication.
Mail (like news) is an essentially non-real-time medium anyway. Some
people using lists served by permanently connected server running
majordomo etc actually prefer to receive messages in several large
chunks, hence the option to receive digests which is often on offer.
Messages being retransmitted once or twice a day rather than
immediately after posting is a small price to pay for an advert-free
zone. YMMV of course.

Cheers,
John

Source record: 98043

Hi,

I have a bare power supply that I'm positive is for the 520ST (I owned one for years back in the 80's). The problem is, is it for the external floppy drive (if so, which one, the SF354, the SF314, or both?) or is it for the 520ST itself?

Here are the specs.:

Part #: CO70042-01
Input: 117V 60Hz 22VA
Output: 5VDC 1A

My hunch is that it's for the floppy drive as it's on the small side.

If you can help, please e-mail me at:

chrism@snip.net

Thanks in advance!

Thanks for all of the suggestions... to answer a couple of them; I dont seem to have any problems reading commercial floppies on either the Atari or the Mac... the disc drives seem to be working fine, but of course compatibility is another question... I guess I just have to keep tinkering... while I'm at it, I've been thinking about switching to Logic on the Power Mac... would my files transfer there (assuming they will transfer anywhere)?

Thanks in advance

: one!)

Well I don't know about ExtenDOS Gold, but our club bought ExtenDOS Pro a while ago and it most certainly would not read multisession discs, at least not for me. I contact Roger Burrows about that and from what I can remember he said that multisession would only work on particular model CD-ROM drives, evidently mine wasn't one of them. Funny that there was no problem any more when I started using Spin.

The trouble is the person who I need to get this driver for can't use Spin because it requires MiNT or MagiC.

How can I be sure that if I recommend this person to buy ExtenDOS, that he won't have the same problem I did (no multisession)? Is there a demo version that I can try, perhaps?

Ive had 1 or 2 CD's that have LFN doc's that end in 'HTML', but the HTML source files themselves link to doc's called 'HTM', so if i double click on a HTML to call cab, it falls on its face when it cant find the other files coz they are called HTM, more a problem with the doc's authour i think.

>works great.
>

Try leaving it on a few minutes. Normally the OS is in ROMs, so it shouldn't need a boot disk. If you put a formatted disk in the drive, then the desktop should come up immediately.

If it's an old 520ST without the integrated floppy drive, then maybe it doesn't have TOS in ROM like all other models did. In this case, you NEED a boot disk (which are impossible to find nowadays) or some new TOS ROMs. You can get some from a broken machine.

This is all in the Quick FAQ.

Cheers,
Nick

Source record: 98277

I just paid BEF 20000 for a TT030 with 8MB ST-RAM, 48MB(!) hard disk,
TTM 195 monitor. The previous owners were happy with the price, so
much so that they threw in a working SLM 804 as well. Meanwhile a
musical instrument shop in the next town are trying to sell a similar
setup for BEF 35000.

Sad observation: the place I bought the TT from used to be an Atari stockist.
They were still using the TT for their own DTP up to the day I bought it,
but they'd covered up the Atari logos because they were trying to lose the
image of being an "Atari shop".

If the resolution is in the region of 480x384 then it may be intended for
viewing on a TV; you can get TV outlets for PCs and of course WebTV *is*
a TV.

Looks like I'm about to join the "how low can you sync?" club of voyeurs ...

I believe so. NetBSD certainly runs on a stock or FX'd Falcon, so I would expect it to work with Nemesis. See www.netbsd.org gor more info.

> is MiNT just the optimised atari version of linux and does it allow
> for running of linux programs?

Neither of the above. MiNT was developed specifically for the Atari platform by one Eric Smith, while Linux was developed (originally for PC) by one Linus Torvalds. The two proceeded in parallel. MiNT runs standard Atari binaries, which are quite different to Linux binaries; an "emulation mode" would surely be possible, but I never heard that anyone did it. (Mucho work).

> I have 163mb of free hd space will linux be happy on this?

Should be do-able, in fact you should even have space for X11. But for that you really do need a co-pro: I tried it without, and you could w a t c h i t d r a w e v e r y w i n d o w s l o w l y .

> compared to an ST or falcon?

The TT030 had a 68030 at 32MHz, built-in SCSI, and could access an awful lot of RAM (so-called TT RAM) in 32-bit mode (ST-RAM is accessed 16-bit). In 1991 it was a pretty awsome machine, especially with that 19" monitor; ideal for MIDI sequencing (Cubase) or DTP (Calamus). In 1998 it still looks pretty good. :)

Hi,

first of, I'm not gonna change to E-mail just to respond to this.
Secondly, kinda funny question... Atari will never make new computer
systems, it should be clear to anyone by now.

To satisfy your "needs":
YES, I'm gonna buy a new TOS-clone... whether that'll be a Milan-060, a
Phenix-060 or Wizztronics depends on availability, compatibility, price etc.

If it were not ST-compatible I would still buy it. My TT isn't ST-compatible
too, and I bought it. What is ST-compatible? Should First-Word be able to
run from it? Never used First Word, I hate it...!

My ST (and also my TT) won't be traded in for a rebate/discount. I need my
ST for old software that won't run from the TT (or successor) - yes, I do
use Flightsim II occasionally, I do use astronomy software from the late
eightties that won't run on a TT.
My TT would "degrade" to back-up system once I get the new clone... and
since it uses VGA/SVGA monitors, SCSI/ACSI devices it's compatible enough.
I'm still investing in upgrading that one (getting 64 Mb TT-RAM - isn't that
ridiculous with the prices for TT-RAM compared to "ordinary RAM" these days?
But hey, the Milan-060/Phenix/Wizztronics aren't out on the shelves yet -

Hope that answers your questions, if you bother following this NG.

You're welcome...

>Doesn't sound like you have the same problem as Mike tho'.

Right I had another go last night. Here's the results:

Started Newsgroup list d/l. It successfully got to just over 1350000 bytes. It then sorted, then it started writing file (according to dialogue box messages), then it came up with a '68000 exception error - #69' message and crashed back to the desktop.

The resulting file on disk was again around 623000 bytes, with a tiny index file.

I had about 8Mb RAM free at the time.

In a former life as an exotic dancer, jperez@Hawaii.Edu (John Perez) wrote:
> This is a TT only monitor, I believe it is a TTL type, and plugs into the
TT monitor/VGA port. It will not work on the Falcon or ST. The TT monochrome
from Atari and Moniterm are very similar in function. They look fantastic
for MIDI sequencing and desktop publishing. They are paper white and high
contrast - very easy on the eyes for long term computing. If you have a TT
and prefer resolution to color, this is a terrific monitor to use.
>

It's an ECL (emitter coupled logic) device, rather than a TTL
(transistor-transistor logic) device. ECL is rarely used, because it has very
strange logic levels, but it is one of the fastest (if not _the_ fastest)
logic families available - hence its adoption in this case (high speed data
because of the high resolution at a decent refresh rate). I've never used
one of these devices, but I've witnessed one in operation, and it looked _very_
nice (especially for DTP, Music notation, etc.)

Anyway, just my bit of pedantry for the day ;)

I'm an electronic engineer (previously an electrical engineer), currently working for a company doing R & D on flat screen displays. I wouldn't be able to fix a video or TV though (well, not without a manual and some practice) as I'm more inclined towards digital than analogue.

>
> x> "I'm too artistic to be a scientist and too scientific to be an artist;

Nor me, though I can design: I just need someone else to actually draw or model the thing, but under my instruction. I can drive a CAD station quite well though, so I can get away with initial design work on that.

My artistic streak comes out most in my hobbies of music & writing, though as an engineer I have an interest in the human aspect of what I'm designing - the aesthetics, ergonomics and anthropometrics of it all. Personally i put it all down to my left-handedness.

I have a complete Mega ST4 system and a TON of software for sale. Sale is open to all. I would prefer to sell the whole package as one lot, but will consider offers for individual pieces of software or hardware.

Package Price: $425 (US)+freight, or best offer. Inquiries should be directed to:

WFChris@aol.com

The package includes the following:
Hardware
1 Mega ST4 & Keyboard
2 Monitors; 1 SM124 momchrome & 1 SC1224 color
1 monitor switch box
1 mouse
1 joystick
1 MouseMaster switch box
1 ICD 44 mb Syquest drive
1 SF314 external floppy drive
1 Cannon BJ10e bubblejet printer
1 Supra Modem 2400 (ok, its not very fast, but it was good enough for GEnie)

Software
Applications
Calamus v 1.09.6 & 1.09N
Flash
Clean Up ST
Word Perfect
Degas Elite
Data Manager
Word Flair
various utility programs such as NeoDesk

Games
Maniac Mansion
Empire
Star Wars
Gauntlet
Warlock
ArcticFox
King of Chicago
Thunderbirds
SimCity
Ancient Art of War in the Skies
Steel Empire
ShadoWorlds

Balance of Power (1990 ed)
Rorke's Drift
Railroad Tycoon
Storm Master
Populus
Power Monger
War in Middle Earth
Defender of the Crown
Lemmings
Hitchhiker's Guide to the Galaxy
F-16 Combat Pilot
Star Glider
Jeanne d'Arc (in German)
The Secret of Monkey Island
Autoduel
Hard Drivin'
Civilization
Realms
Their Finest Hour: The Battle of Britain
Frontier: Elite 2
Thrid Riech
Pirates!

>Can someone please post a working QED command line?

I use Everest which works fine, FWIW. Some things to try though
(apologies if you've tried these already):

1 In the editfmt line, try removing any other parameter than %f in
case %l is confusing QED.

2 Check that editwd is set to the directory QED is in (if it isn't
set to that already) in case the file it can't find is the
resource file or some such, as opposed to the file to be edited.

>Also, I can't read some of my message groups. They show up in the group

Beats me I'm afraid. Might be worth reporting the problem to the
author.

>And in the config file is a config statement to turn on or off crosspost
>handling. It says to see docs for further info. However, I can't find
>anything in any of the docs/manuals. What exactly does this switch do?

From OKAMI.HYP (try the Crossposts entry in the index for the full
story :-)):

----------8<----------

Crossposts Okami

Crossposted messages (i.e. messages which are posted to more than
one group simultaneously) can be marked "read" automatically in
all newsgroups in which they occur. For this option the variable
"handle.xpost=1" must be set in o.inf. SOUP/UQWK users will do
better to call UQWK on the host with flag `+x', to exclude
crossposted messages from the SOUP packet entirely.

Crossposted messages can also be targeted for any flags in the
"Set Msg Flags" dialogue box by selecting the "Crossposts" option.

----------8<----------

That said, I have it switched on but it doesn't seem to do anything
with messages crossposted between c.s.a.s and demon.ip.support.atari,
though I've never got round to definitively finding out if the problem
is Okami or Newswatch as Newswatch occasionally mishandles crossposts
and might be affecting Okami.

>And finally, is there any way to save the message window position? I know
>you can adjust the size, but it's still placed all the way to the upper-left
>corner, which presents a little bit of a problem on my overscan display.
>(Yes, I've adjusted it as best as I can.)

Don't know about this one as I've always just used the default
setting (full screen) in ST-High.

HTH in places at least,
John

... no it aint! I have had my 1040 STF from new in 1988 and last year
upgraded it to 4Mb to run Cubase from a RAM disk... and I get online
with CAB and IRC from the RAM disk too, thanks to my ï¿½90 upgrade. I
have no HDD so it was a quick fix for me.

It is a useful machine to have as I like Kick Off2/Player Manager and
of course, the MIDI which is what it was bought for.

I have a DOS palmtop (running Windows 3) and IBM W95 laptop too (runs
PacifiST). I use Ghostlink to talk to the palmtop (the laptop doesn't
want too!).

Only by a copy and paste operation via the clipboard - but you're limited to
the amount of text that will fit the window.

Otherwise I guess that you could just upload the text file to your web site
and point babelfish at it.

Speak to 'ya later!

It shouldn't be needed if you click 'save' with an activated STinG,
activated in the STinG Internals CPX, not the Port set-up.

This is a well known problem. The Fireball disks can't be used to record audio in CAF. They can however be used for playback. There is no solution unfortunately :(
Check out my homepage to check out which harddisks really do work with CAF - and learn more about the system and how to solve some other problems.

The number of cylinders is not required at all. The only piece
ofinformation programs for partitioning SCSI drives need is the number
of sectors. Physical parameters are irrelevant for SCSI.

> The main point to watch is, never use partitions bigger than 300 Mb on a TT.

There is absolutely no problem in using partitions larger than 300 MB
(up to 512 MByte) with the TT, i. e. with TOS 3.0x. WIth MagiC or
Big-DOS even partitions of up to 1 GByte are allowed for the TT.

I have successfully done this using a Jaz drive and Big Dos. However, if I understand correctly, you need Big Dos version 6 with the Falcon. Also, if you run Screenblaster and NVDI, you need to disable one or the other when you are running Big Dos.

Hi Matt. I'm the Sysop at the DarkForce! BBS. We've been running a prize
give-away for over a year now, and what we do is give a 6 month/3 volume
subscription to Atari Computing to one lucky Atari caller each month. We
had gone with Rich Tietjens for awhile, but because of a definite lack of
service, we've now switched to SFT. SFT has been prompt and courteous. I,
and most of my winners are -still- waiting for issue 8 from Rich Tietjens
as well...and we have it on good authority that he does have the mags. As
to why he has not shipped them? Your guess is as good as mine. Anyways,
just do yourself a favor and go with Systems For Tomorrow... Later! ;-)

n> I use Everest which works fine, FWIW. Some things to try though
n> (apologies if you've tried these already):

Guess I might have to give that a try next, but I can't imagine why QED wouldn't work.

In case it comes to that, what's your editfmt parameters for Everest?

n> 1 In the editfmt line, try removing any other parameter than %f
n> in case %l is confusing QED.
n>
n> 2 Check that editwd is set to the directory QED is in (if it
n> isn't set to that already) in case the file it can't find is
n> the resource file or some such, as opposed to the file to be
n> edited.

I have it set for both of these, but QED gives me an alert stating: "Error whilst reading the file 00000000.TMP". I assume that's the file that Okami wants it to edit. I tried writing a message with that filename in both the QED directory and the Okami directory, and in both cases Okami said I hadn't written a message, so if it's looking for that file, it's looking elsewhere.

n> Beats me I'm afraid. Might be worth reporting the problem to
n> the author.

Regarding not being able to open certain groups, I imported some new mail today and the import program stated there was no index file for those groups, and it said it was creating them. However, I still can't open those groups in Okami. I was able to start another alt group, though, so that apparently WAS just a coincidence that it was only alt groups where that was happening.

n> From OKAMI.HYP (try the Crossposts entry in the index for the
n> full story :-)):

Ah, I only looked at the Contents page. Never thought to check in the index. <groan>

Thanks for your help.

>I use Everest which works fine, FWIW. Some things to try though
>(apologies if you've tried these already):

With any luck, this message will get to you via Okami. I figured out the problem and I'm almost embarrassed to admit what it was. The temp paths were set to /oasis/tmp instead of /okami/tmp. I don't even use Oasis, and was just changing all /okami/ paths to match my own. I obviously mistook /oasis/ for /okami/ on those two paths, even though, now that I think about it, he was using /o/ instead of /okami/. Oh well. It's a lot to take in for one session.

Now I just need to figure out why I can't open all my groups. The importer says no index exists, yet it does. Those groups look no different to me than the ones that are working. Guess I'll fire off an email to the author.

Thanks again for your help.

1801. FS: SLM605 Laser Printer

Newsgroup: comp.sys.atari.st
Date: 1998-07-01 00:00:00 UTC
From: John Kolak <jkolak@jps.net>
Message-ID: <359AEF44.4125936F@jps.net>
Source record: 98014

For Sale: Atari SLM605 Laser printer. This printer is the same as the Espon EPL 6000 laser printer, except for the Atari DMA interface, so supplies are much more readily available and at a lower cost than the supplies for the SLM804 printer. Requires an Atari or Atari compatible computer with a DMA port (no Falcons).

Excellent condition and prints out beautiful deep black printouts, but drum has 3 small blemishes, so printer is only suitable for casual use or proofs until the drum is replaced.

Asking $49 or best offer plus shipping from California.

Thanks,

jkolak@jps.net

>often used in portable because of their lower power consumption.

I also have a Supercharger. The V30 is essentially a redesigned 8086, as evidenced by the fact that it uses the 8087 as a coprocessor. However its instruction set is a superset of the of the 8086 set. It includes all the additional instructions recognized by the 80286, except for the memory protection instructions, plus some additional NEC only instructions. NEC was said to stand for Not Exactly Compatible.

This was because a couple of obscure faults in the 8086 were fixed in the V30. A program which took advantage of any of those faults would fail on the V30.

Eric Isaacson's wonderful A86 Macro Assembler worked just fine on the Supercharger/Atari combination and Eric's manual contained a good description of the quirks of the V30.

Because the V30 had only a 20 bit address bus and no memory protection it could only run Windows 3.0 in real mode, which was next to useless.

Hi:

I'm looking for a Jaguar Flash ROM cartridge. If you have one available,
please e-mail me at KevinManne@wycol.com with your price.

Thanks,
-Kevin

> link:

I guess we all agree: Atari could have been a contender, but it suffered through several managements that just didn't manage. It's no sadder today than when you and I first discussed it; in fact, I think the situation is even brighter today than six months ago because of what I see in this ng, on the mailing lists, in FidoNet, and from users in general.

o>
o> Is that a list with a permanent connection?

Nope...

I'm using net2net as a part of my bbs. The bbs is automaticly connecting
twice a day to get mail en news... That should be frequent enought to run any
list.

I have a couple of lists running for more than a year.

No problems so far :-)

=>by ATARI CORP, and needs another Wincap (?) version.

SCSI hard-disks don't require any WINCAP, because the information about the number of cylinders is passed by the drive itself, when requested by the formatter.

The main point to watch is, never use partitions bigger than 300 Mb on a TT.

Assides from this, everything should run smoothly.

>Just some questions for all the Atari users out there:

>1. If Atari came out with a new computer system would you buy it?

I'll rephrase your question to: would you buy a new,
more-powerful GEM/TOS compatible clone computer? The
answer is YES.

>2. If the system were not compatible with the ST would you still
>consider it?

If you're talking about abandoning the integrated
keyboard/chassis (i.e., non-compatible packaging) the
answer is YES.

If you're looking to develop the Falcon computer
further (that assumes compatibility with existing
Falcons, BTW), the answer is YES.

If you're talking about abandoning some of the standard
ports (i.e., MIDI, Mouse, Joypad, Cartridge, or DSP)
the answer is NO.

If you're talking about abandoning the GEM/TOS operating
system (i.e., BIOS, XBIOS, GEMDOS, VDI, AES, etc.) the
answer is NO.

>
>3. Would you buy the new computer if offered a discount or rebate for
>your ST?

No. I *would* get excited if the new computer
explicitly supported some form of DMA to an ST
that could be used as a dedicated printer buffer
that supported dot matrix printers, ink jet printers,
parallel-port laser printers and DMA laser printers
like the SLM 804).

> > are disks formatted on the Atari able to be read by the IBM?
> NO !

YES! It depends on your TOS version. IIRC TOS 1.06 and above can format PC compatible disks. I have no problem with my TT and formatting PC compatable 720 and 1.44 disks. Keep in mind that the PC's will not tolerate "unusual" formatting so do use any formatting settings (increased # of tracks, etc) that increase the amount of info you put on the disk.

If you want the best compatability format the disk on a PC - but even this is not a sure-fire solution :)

Whilst it's fair to include the Atari they totally ignored the Amiga
achievements. The first multitasking GUI on a home computer surely deserves
a mention, doesn't it?
```

1816. ScanX and E3+

Newsgroup: comp.sys.atari.st
Date: 1998-07-01 00:00:00 UTC
From: michael@fastlane.net
Message-ID: <6C93C2A1500254D5.8B3ED8FA8F60B3BD.E8453EA7F6232A5C@library-proxy.airnews.net>
Source record: 98063

Hi all,

I just purchased ScanX for Microtek and an E3+ for Mac scanner
(the one with a real SCSI and a Mac SCSI connector on the back).
Here's the configurations I've tried, with identical results:

Falcon-->50 pin SCSI Scanner w/ and w/out Terminator
Falcon-->Tape Drive-->CD ROM->Mac SCSI-->w/ and w/out Terminator
Falcon-->50 pin SCSI Scanner-->Tape Drive-->CD ROM--> w and w/out Terminator

Before doing anything, if I run ICD's ID Check program, all devices
are seen on the SCSI bus.

When I start up MTEK_030.PRG and attempt to test the device
(ID #2, ID 0 is the tape drive, ID 1 is the CD ROM), it says
"Wrong Device". The green "Ready" light then goes out on the
scanner.

Subsequent attempts to test the device cause a "Device Not
Ready" alert to pop up. If I exit MTEK_030.PRG and attempt to
run ICD's ID Check program again, it hangs when attempting to access
the SCSI bus.

MTEK_ATA.PRG crashes when I attempt to run the test and locks up
my machine.

I see these problems even with a bare-bones system.
BTW, I'm using HDDriver, 7.12.

Any help would be greatly appreciated, so thanks in advance.

Michael White (michael@fastlane.net)

> Logic on the Power Mac... would my files transfer there (assuming they
> will transfer anywhere)?
>

Well, some STs are a bit finnicky about DOS compatibility, and from
experiance I'd say that the same can be said about Macs, so that gives
for a lot of randomness when floppy tranferring between the ST and a
Mac.

The files you are interested in transferring seem to be midi files, so
you might want to try the following:
- Connect ST MIDI Out to Mac MIDI In
- launch sequencer software on both machines, load the ST files into the
ST sequencer.
- Set your Mac sequencer to "external sync" or "external midi clock" or
whatever it might be called.
- click on record on the Mac, and then play on the ST.

The other option is to either send yourself an email as someone
suggested, or more elegantly, use a ZModem terminal on both machines
with a serial connection.

> Thanks in advance
> Andrew
> San Francisco

If all else fails, I'm sure there is an Atari user in San Francisco who
would be happy to transfer your files to a DOS disk.

Cheers,
Nick

All,
Speaking of the Amiga, Gateway has announced that they are working on a
new Amiga computer. OS 4 will be a tempory OS for software companies to
build apps then when the new machine hits the streets next year, it will
have OS5. They said that this machine will be better than any consumer
PC available.

Your best bet will probably to get an ST emulator for the PC, so that
you can run the ST conversion programs.

Cheers,
Nick

Hi,

The Atari ST2DISK v1.04 is available.

ST2DISK is an utility to make, with the atari computers, the floppy
disks from the PACIFIST .ST image files.

New features :
- Bubble GEM support
- Check for the executable boot sectors and ask to disable them
- Recover an executable boot sector disabled by ST2DISK

You can directly download it at the following address :
http://wwwusers.imaginet.fr/~nowak/st2disk.zip

Pascal

AFAIK Logic on a Mac will read files from Logic on any other platform
(including Atari), Creator and Notator *.SON files, and of course, *.MID files.

Probably worth checking with the distributor though.

1835. SLM605 how to clean safely

Newsgroup: comp.sys.atari.st
Date: 1998-07-01 00:00:00 UTC
From: Alyre Chiasson <chiassa@umoncton.ca>
Message-ID: <359A44FA.C9593FD6@umoncton.ca>
Source record: 98082

My SLM605 need cleaning in a bad way. There is toner residue in several areas, general dust and I imagine the gears need some form of maintenance as well. The local computer shop does clean laser printers but "don't do Ataris". I may just show up with the printer and ask to see the technician - I have heard that the mechanism is the same as the Epson ?? Maybe I can convince them.

If not, how should I clean the thing? The manual they included is for the SLM608 and the layout is not quite the same. The only way I can see to removed the spilled toner is to vacuum. I have a computer shop vac but I am concerned that the bag may not be fine enough to retain the toner. Since this is a hazardous substance I don't want it flying about in the air. Maybe the particle size and the fact that it sticks to about anything would make it a problem - I just have no experience.

Any advice, words of caution, etc. appreciated.

Alyre Chiasson

which version of ScanX are you using? Because there's a new version
out that handles the E3+ (and a few more new Microtek scanners) - it's
version 1.008, and it also fixes a few more bugs I had with the
original version as well (it now works under Geneva). You can find the
new version (it's a demo that can be unlocked to the full version with
the serial number you got from Nima) at the Homa web site at
http://www.magma.ca/~nima .

Who is handling US distribution of Atari Computing?

I have not received an issue since Issue 6 (August 1997). I think I
received it in February 1998. Since then, nothing. This is quite
disturbing as I had just previously renewed my subscription.

I can't even reach the US software archives at teleport anymore.
What happened to Rich Tietjens?

Any information you could provide would be greatly appreciated.

Thanks,

Matt.

Well, I think you need to put a program called CBHD.PRG which should be in
an archieved file in the extra folder. It loads and activates the alternate
SCSI routines (actually it asks if you want to and you select yes) when you
run the scanner driver. I bought Scan-X for the Umax Astra and the same thing
happens. The instructions about CBHD should be in the readme.texts on the disk.

Later,
James

Gateway actually haven't announced anything (AFAIK) but Amiga International
have released those details. They do have full support from Gateway
however, including substantional financial support.
PPC has been dropped in favour of an as yet unavailable CPU/Processor which
supposedly will feature a programmable instruction set.
The new system due in 1999 will be 5-10 times faster then current PII
400Mhz/100Mhz bus systems.
OS 5.0 will be the OS running on this system, with the developer OS 4.0 and
machine (Amiga/PC hybrid) released later this year to allow developers time
to develop applications for the new system and to have them ready when the
new machine is officially released.

Current PPC upgrades will continue to be sold and supported with the manufacturers of these boards (finally) working together to support the Amiga community until the new machine is available.
The OS 3.5 upgrade has been cancelled by AI.

With Gateways backing the Amiga could once again be a viable platform. Besides, we must be due for another platform to kick the shit out of the current Mac and PC systems. How stale can it get ?.

Regards,

Clockmeister.

When using the latest ScanX version from Homa a dialog box appears
before coming to the work window and it ask to you if you want to use
these alternative routines ... so, it seems this problem is now fixed
...

Yes, but only if the the system is open and if people are eventually
able to build one themselves from modular components as well as use
industry standard cases, video cards, etc. etc. I don't care WHAT
cool things they put in it if it is going to be another eighties
style closed up box that can only be minimally upgraded with
manufacturer supplied parts.

Apple will yet die of this disease. We don't need another carrier of
it.

```

I gather it's a 16MHz processor with something called 'pipeline' architecture'. In some cases, in combination with a software accelerator, it seems to have increased the speed of functions by a factor of 3 or more. The latest version also comes with 4Mg of TT RAM built into it (in addition to your existing RAM) and I think it's priced at about £195. I'm considering it myself.

```
Hope this helps.

No! The FIREBALL works with CUBASE AUDIO. I have one and it's do the
job fine.

But, if you have a new FIREBALL, you need BOOTCONF: turn SCSI BUSS
ARBITRATION to OFF and use SHDI.PRG in your AUTO folder as the SCSI
DRIVER.

If you have an old FIREBALL, turn SCSI BUSS ARBITRATION to OFF.

That's all.

Try SHDI.PRG from STEINBERG. If it's not on yours CUBASE AUDIO disks
(possible with some releases), I'll send you by e-mail, I think it's a
freeware.

As innovation@mscbdg.co.uk wrote to All:

i> of the game for many years and have progressed to mission 8 level 8
i> (currently on my 88th planet). I would like to know if I can complete
i> the game before I die of old age.

The first mission is pre-set, and is stored on the ("Ratt-DOS") disk 1.

All subsequent missions are psuedo-randomly generated, like (for
example) the planet data in Frontier. (And you know how big that is!)

So, no, you can't actually reach the end of Captive. Each time you
finish a mission, it makes a new one.

Sorry!

> an email to the author.

I've a problem like yours. It's with Magic, is it ?
I think it's related to the length of the words in the newsgroup names.

Here is an extract of a mail I sent to Jos a few months ago:

(snip)

I've now made some tests regarding long filenames with MagiC (VFAT) and
Okami behaviour.

To sum up:

1- Magic without long filenames.

I use the message base created in single Tos. Okami cannot open NGs like
more_than_8_chars.whatever_chars but it can open those like
8_or_less_chars.whatever_chars

2- Magic with long filenames.

I created a new message base for this purpose.
Okami can now open whatever_chars.8_or_less_chars but cannot open
whatever_chars.more_than_8_chars :-(
(i.e. comp.sys.atari.programmer)
Oimport seems to work as (I) expected but not Okami itself.

(snip)

Note I've no problemo in single Tos, but I use single Tos less and less.

As a remedy, I disabled the groups causing problems in o.inf and then
they go in the pseudo newsgroup 'junk'.

Bye,
/Pascal/

> PC available.

If you ask me this new computer doesn't realy sounds like a Amiga at all. It will only be compatible with old amiga apps through emulation. The OS will be completely new and based on a outside developed kernal like BeOS, or Mach. This you can already be done under Linux. It will not include a Motorola CPU, it's probably going to use intels comming Merced chip, or something else shitty. The "new" amiga which will be like a bridge to the new platform which will be released later this year will be based
on the Pentium, so it's clear that they will go for the x86/intel line like everyone else. Don't forget that Gateway has only made intel boxes and never even seen a PPC.

Basicly it's a completely new computer and OS with the Amiga name on it. It's like buying a PC whith the Commodore sign on it. It has got nothing at all to do with Commodore.

: NO !

Well that's not really correct. Any disc formatted with the desktop format function on the Atari since TOS version 1.4 can be read under MS-DOS (or Windows etc.)

If you have an earlier TOS version, you can simply format the disc using a different formatting program, instead of the one built into the desktop. Alternatively format the disc under MS-DOS, and the Atari will be able to access it.

: > Dos based drive or Zip Drive). It sure would help me out!!!!!

I seem to remember having some trouble with this, but I was able to avoid it by formatting the hard disc on a different computer (Atari or PC). Unfortunately I can't remember any details about that. I _think_ I had to format the disc on the PC to make the PC recognise it, and then the Atari would access it with no problems. However from what I recall, there was more than one level of partitioning under DOS, and it was necessary to partition the disc in the right way before the Atari would read it. I also seem to remember that discs formatted under Windows 95 were accessible on the Atari with no problems. (With the aid of BIGDOS.) That is all from memory, I may have got some parts of it inaccurate.

I'm sorry I can not be more precise, but I hope that helps to lead you in the right direction.

Hi!

In article <6n53rv$4kg$1@soap.news.pipex.net>,
inorton_badrul@hotmail.com (Ian Norton) writes:
> the other thing with vfat is that the lfns can sometimes take up more data space than
> the actual file, especially in the case of very small gifs,

Sorry, but a long filename only needs ceil(# of characters / 13) directory
entries with 32 bytes each, and that's stored in the same directory as the
shortname, not in extra data clusters. I'd like to know how small your
GIFs are, especially because even a 1-byte-GIF takes up one full data
cluster, which is at least 1K.

What's true, though, is that VFAT can cause directory fragmentation,
leading to directories growing larger and larger. But that only happens
in directories where you delete and rename files a lot. And, of course,
deleting files without VFAT enabled strongly increases this risk.

Btw, I'll release CheckFat R4 in the next days, which fill feature checks
for the VFAT structure of a partition. It still doesn't repair anything,
as it's IMO better to repair almost all FAT errors manually instead of
trusting some tool which can make things even worse in some circumstances.

Ciao

Thomas

What about the Digital Alpha work stations?

That are real computers! After an 8 bit spectrum and a 16/32 bit
Atari it is time to scale up again. Not to a lousy 32bit system. That
was interesting 10 years ago. Nope, time to get 64 bit hardware, that
is progress!

The Alpha processor is for serveral years the fastest processor
available. The newest stuff if quite expensive. But if you go for
the outdated stuff you get a good price. Outdated are:
300-400MHz 21164 processors, they come typically with 96kB
2nd level cache and 1Mb 3rd level cache.
(My system, 300 MHz Alpha 21164, 1MB cache, 64MB RAM, SCSI CD ROM,
1GB SCSI harddisk, Matrox Millenium graphics card and ethernet
network was about NLG 2500 or about 1250 US$, half a year ago.)

Take as OS Linux and you have some real computing power on
your desk.

Bye, Hans

Hi,
The demo for ScanX is only available upon request. Please contact me
for more info at: aa414@freenet.carleton.ca

If I remember correctly, your scanner is the 600z which is a three pass
scanner. ScanX doesn't support 3pass scanners.

Hi,
The problem that you are having is because you are using v1.05
of ScanX which is an older version, and doesn't support the new
E3+/#6+/E330/E630, ... SCSI II series of Microtek.
V1.08R1 supports them fully.

I have already emailed you on it on the instructions for downloading the
latest version.

For more info, please email me at
aa414@freenet.carleton.ca

duh. no sh*t.

it's absolute blasphemy to display atari logos in a trashy windoze
screen saver. why don't you just bring an atari or clone at the office
? you're just creeping the atari logo in mud. such a shame. you're a
traitor of the atarian race !

>>unfortunately :(
>>Check out my homepage to check out which harddisks really do work with
CAF -
>>and learn more about the system and how to solve some other problems.
>
>No! The FIREBALL works with CUBASE AUDIO. I have one and it's do the
>job fine.

This sounds great - especially since I've heard from several users that the
Fireball disks can't be used with CAF :)

>But, if you have a new FIREBALL, you need BOOTCONF: turn SCSI BUSS
>ARBITRATION to OFF and use SHDI.PRG in your AUTO folder as the SCSI
>DRIVER.
>If you have an old FIREBALL, turn SCSI BUSS ARBITRATION to OFF.

Well - this makes a new problem appear, since all CD-writers need the
arbitration - so I'd suggest another HD because of this even though it's
possible to get the Fireballs to work with CAF...
By the way - I just thought I'd mention that the Fireball EIDE's work like a
dream - at almost 3MB/s on my setup with one 1.3GB and one 2.1GB EIDE
Fireball disks.

Best regards,
Claes

> standard ST. That's all the information I have on it though!

Here's the info I've got about it, taken from an info sheet they supplied.

There are two versions available, both using a 68020 CPU, at 16Mhz and
24Mhz. The prices are (when I got the info sheet) 99UKP for the 16Mhz
and 129UKP for the 24MHz version. Also for an extra 30UKP the IDE
interface can be supplied with it.

Fitting requires 2 track cuts and 5 solder joints, and the board fitting on
top of the 68000, if socketed. If the processor isn't socketed, it's better
to have them fit it. There is a switch supplied to allow swapping of the
processors. Even with the IDE interface, the board still fits into the
standard case. It's also supplied with TOS 2.06, so an IDE drive can be
bootable.

A comparison, using Gembench 3.28c, with a standard STE, Mega STE at 16Mhz
and a Falcon gave the following results:

clock rate CPU Graphics [1] Average

STE 8Mhz 100% 100% 100%

Veloce 20-16 16Mhz 333% 174% 220%

Mega STE 16Mhz 166% 143% 149%

Falcon 16Mhz 96% 112% 108%

[1] The graphics mode tested was 640x400x2, with the blitter enabled.

All the tests were based on machines running TOS 2.06 (4.04 n the Falcon).

Re: "Okami 1.34", pricard@club-internet.fr scribbled the following on 02 Jul 98 @ 10:11:40:

p> I've a problem like yours. It's with Magic, is it ?
p> I think it's related to the length of the words in the newsgroup
p> names.

Yep, I figured that out too, and sent off an email to Jos about it yesterday. All my problems are with groups with long filenames.

p> Oimport seems to work as (I) expected but not Okami itself.

Actually, it doesn't. OIMPORT reports that there's no index, and proceeds to create a new one. It does create one with the long filename, but for some reason when it's looking for it, it can't find it.

p> Note I've no problemo in single Tos, but I use single Tos less
p> and less.
p> As a remedy, I disabled the groups causing problems in o.inf and
p> then they go in the pseudo newsgroup 'junk'.

Not an option for me. Those groups are too important to me.

If I turn off VFAT for that partition will it then handle all groups, including those with long names (which would be converted to 8+3)?

PR> However, they added things to WDIALOG that cannot be found in MagiC,
PR> IIRC related to printing for instance, that is why installing it
PR> even under MagiC still makes sense.

The extra bells and whistles found in print dialogues in program such as CAB seem to be greyed out - no possibility to print only odd or even sheets for example.

Worse is the complete replacement of Texel's print dialogue however -print preview and everything completely taken over!

PR> AFAIK MagiC (the binary) is entirely by Kromke. Same for MagXDesk.

We're all looking forward to MagiC 6 in the UK, is it available yet in Germany, System Solutions last claimed that it was only in Beta?

Speak to 'ya later!

Excellent news: I haven't got around to installing the new version
yet, maybe this weekend.

Thanks,
John

Glad you found the problem. I hadn't considered the temp directory as
a possible culprit.

The setup is a lot to sort out initially (I had a couple of similar
problems ISTR), but once you get into the swing of it it's really nice
to use. The TTP utilities have a lot of potential for scripting
purposes, which I've only tinkered with at present, though I did
manage to get a method together for dealing with selective message
downloads in conjunction with NEWSwatch's header-only facility and GET
file (currently unused but it does work quite nicely).

>Ah! If you could do the same for retrieval by numbers...

Ah! But that's the problem with retrieving by numbers! ;-)

Retrieval by numbers doesn't use the history file. It can't because if
you're retrieving by numbers then you don't know what the message-id is, so
you can't check in the history file to see if you've already got it from
another group. Hopefully the following example will clarify this:

Retrieval by message id

Group 1
Has msg-id1, msg-id2, msg-id3

So I retrieve msg-id1, msg-id2, msg-id3 etc.

Group 2
Has msg-id1, msg-id2, msg-id3, msg-id4

As msg-id1,msg-id2, and msg-id3 are in the history file, I just download
msg-id4.

This is because the msg-id is *the same* regardless of which group it
is in (it's just unique to that message).

Retrieval by number

Group1
Has msg-number1 (which has msg-id1), msg-number2 (msg-id2), msg-number3
(msg-id3).

So I retrieve all three messages (I don't know the msg-id until i have
downloaded at least part of each message).

Group2
Has msg-number600 (which has msg-id1), msg-number601 (msg-id2),
msg-number602 (msg-id3), msg-number603 (msg-id4).

The only way to prevent downloading of 600, 601, and 602 is to partially download them and then compare the msg-id's against the history file (assuming I stored them in the first place). This makes the processing more complicated and slower. I would still have to at least partially download each message anyway.

Having now explained it, I guess I could do this, but I'm not too keen (unless a lot of people complain about it I guess) :-)

On 1 Jul 1998 16:03:32 , Matt Faehnle wrote:
>Who is handling US distribution of Atari Computing?

SFT are the only importers of the magazine to North America now. In turn they supply Computer Dungeon, Chro_Magic and possibly some other dealers with copies. We will no longer supply Computer Direct in Canada, and sadly Rich Tietjens has failed to distribute recent issues of the magazine in a reasonable manner, and we have asked him for an explanation on many occasions, and not received one :-(

>I have not received an issue since Issue 6 (August 1997). I think I
>received it in February 1998. Since then, nothing. This is quite
>disturbing as I had just previously renewed my subscription.

It's also very disturbing and distressing to us. Rich ordered and paid for a supply of issue 8 of the magazine and these were despatched to him a considerable time ago. He has totally failed to respond to letters and emails sent by us since after we received some complaints from his customers and we are naturally very angry that he has taken money from people and failed to supply them with copies of the magazine.

>I can't even reach the US software archives at teleport anymore.
>What happened to Rich Tietjens?

If anyone know, we'd sure like to know as well!

>Any information you could provide would be greatly appreciated.

Even if it's not so good news, at least you are aware others are aware.

I would suggest that you, and any other readers of this NG who have encountered problems, write him a legal-type letter asking for an explanation and a refund of monies outstanding. If he fails to respond within a set time I think you have a very good case for the relevant authorities to help you with.

If we can help with further information please get in touch.

But for now, I would advise all readers of this NG to only take out subscriptions in NA with SFT or the other reliable dealers they supply (list available on request). Naturally, anyone, anywhere, can take out a direct subscription with us the publishers, but we would always like you to support your local Atari dealer if they stock the magazine.

Kind regards
Mike Kerslake

Well, I'm not complaining, but it _would_ be nice. :^)

It would especially be nice if it also checked for number of newsgroups and throw away any message with more newsgroups than a number defined by the user (preferablly individually for each group). So if the user defined maximum newsgroups as two, and the message came in crossposted to three newsgroups, it would be thrown away. This would get rid of a LOT of spam. Yeah, it would slow things down, but then, so does spam, especially in binary groups.

n> but it does work quite nicely).

Yeah, I want to experiment with that once I get everything else worked out. I'm currently using NEWSwatch/Net2Net/LED/Make_Get for viewing and saving headers and creating GET files. I think using Okami might be faster (though LED makes it easy to save many consecutive messages -- I'm not sure if Okami can do that).

If everything works out, I might eventually dump my Fido setup altogether, as I'm finding my Fido networks less and less useful. And Okami imports and exports mail many times faster than N2N.

What else is new? At least the part about ignoring emails. He's ignored email and netmail COUNTLESS times from me in the past, even when delivered direct to his BBS. Eventually, I just wrote him off as an ingrate. Fortunately, I never ordered anything from him, so he never had a chance to rip me off.

A few months ago he sent me email, acting like we were good buddies, and wanted to sell me his Atari hardware and/or software (I don't remember which). It seems like he was getting out of the Atari scene, but again, I don't remember for sure. Naturally, I ignored his email. :^)

If he did indeed get out of the Atari scene, that might not bode well for those people who paid for those magazines. Hopefully, he'll come correct and give them what they paid for, or at least return their money.

That sucks. Remember that mag that was coming out for the Falcon when it was
new? Was named after the expansion slot, I think. I subscribed and I don't
think a single issue was ever released. :^(

My Falcon gets little use these days so I thought there might be someone out there in the land of Oz who would make better use of it?

- Unmodified Falcon 030
- 4MB RAM
- 84MB internal IDE drive
- 1.4GB external uncased SCSI hard drive (note - crude home made cable but it works!)
- VGA monitor adapter (sorry, I'm keeping the monitor itself)
- Jaguar joypad
- heaps of software - eg.

Protext 6.6
Prodata
Atari Works
NVDI 4
Neodesk (latest)
Geneva (latest)
Musicom 2
Stalker (latest)
Steno
CAB 2.5 (haven't managed to get STinG to work yet though)
PPP-Connect (but no MagiC to go with it...)
Pagestream 2.2UK
heaps of cover disks, ST and Falcon utilities, various ST & Falcon games...
... >200MB of disk space consumed!

Reasonable offers to me by email please or my phone is (08) 9411 6414 (work) and (08) 9299 8152 (home). If phoning, please bear in mind time differences and the fact that I have 2 young children who need their sleep!

I have decided to release my program Zorg as a freeware under GPL.

The archives are on ftp.lip6.fr in /pub/atari/Incoming and should be
moved to the Disk/ directory soon.

The files are:
- ZORG_210.LZH for the binary without any limitation
- ZORG_SRC.LZH for the sources (Purce C 1.1)

If someone wants to continue the developpement please contact me.

Questions and/or answers by mail as I have no time to read these
newsgroups.

> Anyone know about this printer?

You can use your normal centronics printer cable. There is no need for the serial interface which is mainly used on the Mac.

Use a HP II printer driver to drive the printer. This has worked fine on a Brother HL-630 printer connected to my TT and Hades 060. HP II drivers are supplied by most software. e.g. NVDI, Calamus and Papyrus.

Am I correct in my thinking that in NOS mode, Okami expects batch.txt to be in the same directory as the message bases, e.g. "newsdir", unless you use the -r switch in oimport?

So unless you store your messages there, the only way to have it get your batch.txt from your spool\articles\ folder is to use the -r switch? And by doing that, it will not check your mail, unless you also use the -m switch, which only looks for one specific mail file?

Here's is my current import batch file:

```
cd d:\okami\
d:\okami\oimport.ttp -M n
d:\okami\oimport.ttp -M n -r d:\net2net\spool\articles\batch.txt
```

The first oimport line gets all mail, regardless of the address (provided it's in my passwd file). It also checks for batch.txt in my newsdir, which is not where it goes, since I don't put my messages in spool\articles\, but that is where NEWSwatch puts batch.txt.

The second oimport line gets my batch.txt from the proper directory, but doesn't check for mail.

It's no big deal, but is there anyway to combine these into one command line?

Also, in the oimport docs, it says:

```
-m f
import mailbox file `f' (`-' = stdin)
```

What does "('-' = stdin)" mean?

Thanks.

|YES if you use ST2DOS (ST app) but it will mangle the Boot sector if
|it is a autobooting app, so only good for data/file usage

Also yes if you use DFORMAT.PRG which was supplied with Diamond Back. The version supplied with DB2 offered the ability to write a DOS compatible boot sector - this seems to have been taken out of the latest version. You need to select the straight forward protocol (9 segments, 80 tracks I think).

Ah, now I understand the limitations of which you were speaking.

Fortunately, I don't have any of the latter type (at least not yet --
I haven't messed much with my binary groups yet, and I don't
remember if any of them have long paths).

Have you managed to uudecode long filenames, or are you stuck with
the 8+3 file selector (that or decode them manually)?

Forsale 7-3-98

MEGA STE SETUP

TOS : 3.06
RAM/Memory : 4mb
Speed : Faster then stock!
Int. Floppy: 1.44mb

This Mega Ste has had a little (about 2 full days!) work done to it.
It's very hard to explain, but this Mega Ste is faster then other stock
Mega Ste's. This machine is ROCK SOLID and I've been able to run more
software then others.... (3 others have been in town, to compare it to)

Also comes with:

* Golden Image DS/DD external disk drive (new condition)

* Power/Surge protector strip

* All cables and power cords needed

* About 450 PD/Shareware disks (all catagorized, and labeled)

* 5 NICE disk boxes (slide out, stackable. holds 90 disks each. Locking)

* Golden Image mouse with mouse pad

* SC1435 Stereo monitor (slight mark on it)

* ICD (original) software (no manual)

* 1.05 GIG INTERNAL HARD DRIVE (autobooting w/ICD)

* Mega STE users manual

Asking $400 USD + shipping (I will pay insurance)

PLEASE REPLY VIA EMAIL ONLY! danbrown@cet.com

Hello ethhoack,

e> it is truly an absolute blasphemy to display atari logos or "desktop
e> themes" in a windoze system. this is the right fact. it'd be like
e> bring porn magazines at the sunday mass.
I think, you mix up something!!

It's like to bring a bible to a sex shop!!!! 8-)

PS: At least, if I don't work with MagiC PC (or other emulators), I feel
very
comfortable at my windows system, using a GEM alike desktop for Windows
("Grips" from CCP, the creators of GEM Artline) and looking at the Atari
mouse cursor and the "busy bee" :-)
PPS: Hmm, I should install the Atari font as the windows system font at
least
...

Greetings, Oliver

: instead of haemorrhage, esophagus instead of oesophagus etc).

: John Logan

I do not understand. Are you talking of Papyrus 4 or 5?

As far as I know Papyrus 5 only containts a British dictionary NOT an
America dictionary. Thus if you are speaking of Papyrus 5 then these
spelling anomalies are due to the British dictionary.

Please, make a formal complaint to your dealer this is the only way to get
this resolved.

1935. My new 520ST

Newsgroup: comp.sys.atari.st
Date: 1998-07-03 00:00:00 UTC
From: Scott 'Steg' Hansen <steg@airmail.net>
Message-ID: <876DDB4E0892B332.B81E207682C3C04B.007885EF85C47744@library-proxy.airnews.net>
Source record: 97865

Hi All,

This is my first post in this ng, but a recognise a few names from my regular haunt, rgvc.

This morning I found an Atari 520ST, with an SH204 hd, two SF354 floppy drives and two SC1224 monitors... all for less than $16.00! Now, this little set-up didn't come with any power supplies, so I don't know if any of it works just yet... I hope it does, cuz I've been wanting one of these for so long.

Well, I was wondering just what this thing can do... can I use it to hit the newgroups? the net? I've seen some talk here on connecting it to other machines (like an Amiga or PC)... and, I'd like to know where I can find the Quick FAQ... you know, basic ST newbie stuff... =)

Thanks in advance!

Thanks for the info... =) I may have a lead on a p/s already...

But, where can I find the Quick FAQ?

Nostrodamus phrophesised this from bales@hol.REMOVE.THIS.fr to All...

Hi Nicholas!

b> Organization: Storage Technology Corporation
b>
b> I just routinely checked out the TUS homepage which was under
b> construction for quite a while, and came across what seems to be a
b> new VELOCE accelerator board for the STE. Has anyone got any details
b> about this ? price? CPU ? etc ?

Seems to be very good - it's a 68020 CPU and there's the option of their IDE interface. I don't have any pricing details, surprised that it's not shown.

Speak to 'ya later!

Hi Alyre!

c> Organization: UDM
c>
c> My SLM605 need cleaning in a bad way. There is toner residue in
c> several areas, general dust and I imagine the gears need some form
c> of maintenance as well. The local computer shop does clean laser
c> printers but "don't do Ataris". I may just show up with the printer
c> and ask to see the technician - I have heard that the mechanism is
c> the same as the Epson ?? Maybe I can convince them.

One thing I've learnt when buying peripherals for my Atari is to not admit that that is what it's going to be used with - or suffer the same shake of the head that you've described.

In your case I'd take the printer back to the shop and tell them that it's a Mannesman Tally MT906 printer - and they will be quite happy to clean it for you and yes, even sell you toner and a new drum if you need it, together with the page counter module.

Speak to 'ya later!

Hi Folks,

there seems to be a little Problem with my SLM 605.
After changing the Drum, due to lack Prints, after a few Weeks the
Change Drum LED lits.
Is there a Way to get that fixed ??

Thanks in advance !
